

The Proposed Action would result in approximately seven acres of additional open space. It would not use any energy upon completion, other than minor amounts of energy to operate maintenance equipment to maintain the open space in an attractive state, consistent with other Village-owned open space.

There would be minor energy use on a temporary basis during the building demolition. This would consist of construction equipment, trucks to haul away waste, and personal vehicles of workers travelling to and from the site.

Overall, the project would represent a net energy reduction, as the electricity currently used to maintain and secure the building would be eliminated.
