Executive Summary

This document is a Phase I Environmental Site Assessment (ESA) prepared to determine recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs), historic recognized environmental conditions (HRECs) and/or business environmental risks (BERs) in connection with a portion of the property formerly utilized as the St. Paul's School, located on the north side of Stewart Avenue, between Hampton Road to the west and Rockaway Avenue to the east, in the Incorporated Village of Garden City, Town of Hempstead, Nassau County, New York (the "overall property"). The overall property is identified as Section 33 – Block 92 – Lot No. 65 on the Nassau County tax maps. The Nassau County Tax Assessor records indicate that the overall property is identified by the street address of 36 Cathedral Avenue; however, this street address is also associated with a property located to the southeast, and the overall property is commonly known by the street address of 295 Stewart Avenue. For the purposes of this Phase I ESA, the overall property is identified with the street address of 295 Stewart Avenue.

The overall property is improved with numerous buildings formerly utilized in association with the St. Paul's School. The St. Paul's School began operating in the 1890s as an endowed Episcopal School and closed in 1991, following a bankruptcy in the Episcopal Diocese. The Village of Garden City purchased the property in 1993. The buildings associated with the overall property are described below:

St. Paul's Cathedral Building

This four-story building with basement is located in the southeastern portion of the overall property. Constructed circa 1883, this is the largest building on the overall property. The basement of this building was observed to consist of utility areas, storage areas, suspected staff living quarters, classrooms, a locker room, food preparation and kitchen support areas, and maintenance areas. Sewer access points were also identified within the basement of the subject building. A cathedral is located on the second floor of the overall building, with the remaining visually inspected portions of the subject building consisting of classrooms, dormitories, common areas, and kitchen areas. This building has been vacant since circa 1991.

Ellis Hall

This building was constructed circa 1969 and was formerly utilized as a library and science building. Ellis Hall was located to the east of the St. Paul's Cathedral Building and was demolished in 2014 due to concerns related to mold and asbestos.

Cluett Hall
Cluett Hall was constructed circa 1898 and was originally utilized as a gymnasium. This building is currently occupied by several tenants.

Field House
The Field House was constructed circa 1962 and is located directly north of Cluett Hall. This building is currently occupied by several tenants.

Cottages
The cottages are located to the north of the St. Paul's Cathedral Building, and northeast of the Field House and Cluett Hall. The three southernmost cottages were constructed by 1962, and the three northernmost cottages were constructed by 1976. These buildings are currently utilized as the Garden City Recreation Department and Administration Building.

Paved driveways and parking areas are present in the southeastern portion of the overall property, connecting the on-site buildings. In addition, a small playground area is present to the west of the on-site buildings. The northeastern, central and western portions of the overall property are utilized as recreational fields and landscaped areas.

The Incorporated Village of Garden City is proposing to repurpose the St. Paul's Cathedral Building. The current proposal includes the transformation of this building and the area immediately north into the "Centre at St. Paul's", a recreational facility to be utilized by the community. Portions of the building are proposed to be preserved, with the remaining portions demolished.

The purpose of this Phase I ESA is to identify RECs, CRECs, HRECs and BERs specifically related to the St. Paul's Cathedral Building (the "subject building") and the area immediately north of the subject building which are proposed to be utilized in the future as the Centre at St. Paul's.

The elevation of the overall property ranges from approximately 91 to 85 feet above mean sea level (amsl). The topographic gradient of the overall property slopes gently downward to the southeast. The subject building is located at an elevation of approximately 90 feet amsl. Groundwater elevation in the vicinity of the overall property is approximately 52 feet amsl. Based upon a surface elevation of 91 to 85 feet amsl, estimated depth to groundwater beneath the overall property is approximately 33 to 39 feet below grade surface (bgs). Depth to water beneath the subject building is approximately 38 feet bgs. Groundwater beneath the subject property is expected to flow to the south-southwest, toward the south shore of Long Island.

Based on reviews of municipal records, Sanborn fire insurance maps, historical aerial photographs and owner-supplied information, the subject building was constructed

in the southeastern portion of the overall property circa 1883, with Cluett Hall constructed just west of the subject building circa 1898. Cluett Hall was originally utilized as a gymnasium. A residence and associated garage were constructed to the northwest of Cluett Hall circa 1928, along a roadway which originated at Stewart Avenue traversed the overall property from north to south. The southernmost cottages were constructed circa 1957, and the Field House was constructed to the north of Cluett Hall circa 1962. By 1962, the roadway which previously traversed the site from south to north appears to stop at the northernmost portion of the Field House. By 1966, the remaining cottages had been constructed, and the residence and associated garage located to the northwest of Cluett Hall were demolished circa 1969. Ellis Hall was constructed to the east of the subject building circa 1969. By 1980, driveways were added between the on-site buildings and additional recreational fields were present. A larger parking area and a small playground were constructed to the west of the existing buildings circa 2006, and Ellis Hall was demolished in 2014. Landscaped, recreational areas have been historically been present on the western, northern and northeastern portions of the overall property.

Based on the results of the site inspection, records review and interviews, no RECs were identified in connection with the subject building. Several BERs were identified, which are summarized below:

- Storage of various hazardous materials were observed within several areas within the basement of the subject building. These materials included paints, varnishes, cleaning agents such as ammonia, bleach and oven/grill cleaners, strippers and solvents, mastics, and flashing cements. The presence of these materials is considered a BER, and these materials should be removed from the subject building and disposed in accordance with all applicable regulations.

- An out-of-service fuel oil underground storage tank (UST) is present to the south of the subject building. Same is considered a BER.

- The potential presence of polychlorinated biphenyls (PCBs) within building materials and in association with a potential hydraulic elevator is considered a BER.

- The potential presence of asbestos containing materials (ACM) within the subject building and within roofing materials is considered a BER.

- The water damage and potential mold/mildew within the subject building is considered a BER.

- Significant bird guano was observed throughout the subject building, as well as active nesting areas and eggshells. Same is considered a BER.

1.0 Introduction

1.1 Purpose

This document is a Phase I Environmental Site Assessment (ESA) prepared to determine recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs), historic recognized environmental conditions (HRECs) and/or business environmental risks (BERs) in connection with a portion of the property formerly utilized as the St. Paul's School, located on the north side of Stewart Avenue, between Hampton Road to the west and Rockaway Avenue to the east, in the Incorporated Village of Garden City, Town of Hempstead, Nassau County, New York (hereinafter referred to as the "overall property"). The overall property is identified as Section 33 – Block 92 – Lot No. 65 on the Nassau County tax maps. The Nassau County Tax Assessor records indicate that the overall property is identified by the street address of 36 Cathedral Avenue; however, this street address is also associated with a property located to the southeast, and the overall property is commonly known by the street address of 295 Stewart Avenue. For the purposes of this Phase I ESA, the overall property will be identified with the street address of 295 Stewart Avenue.

The overall property is improved with numerous buildings formerly utilized in association with the St. Paul's School. The St. Paul's School began operating in the 1890s as an endowed Episcopal School and closed in 1991, following a bankruptcy in the Episcopal Diocese. The Village of Garden City purchased the property in 1993. The buildings associated with the overall property are described below:

St. Paul's Cathedral Building

This four-story building with basement is located in the southeastern portion of the overall property. Constructed circa 1883, this is the largest building on the overall property. The basement of this building was observed to consist of utility areas, storage areas, suspected staff living quarters, classrooms, a locker room, food preparation and kitchen support areas, and maintenance areas. Sewer access points were also identified within the basement of the subject building. A cathedral is located on the second floor of the overall

building, with the remaining visually inspected portions of the subject building consisting of classrooms, dormitories, common areas, and kitchen areas. This building has been vacant since circa 1991.

Ellis Hall
This building was constructed circa 1969 and was formerly utilized as a library and science building. Ellis Hall was located to the east of the St. Paul's Cathedral Building and was demolished in 2014 due to concerns related to mold and asbestos.

Cluett Hall
Cluett Hall was constructed circa 1898 and was originally utilized as a gymnasium. This building is currently occupied by several tenants.

Field House
The Field House was constructed circa 1962 and is located directly north of Cluett Hall. This building is currently occupied by several tenants.

Cottages
The cottages are located to the north of the St. Paul's Cathedral Building, and northeast of the Field House and Cluett Hall. The three southernmost cottages were constructed by 1962, and the three northernmost cottages were constructed by 1976. These buildings are currently utilized as the Garden City Recreation Department and Administration Buildings.

The Incorporated Village of Garden City is proposing to repurpose the St. Paul's Cathedral Building. The current proposal includes the transformation of this building and the area immediately north into the "Centre at St. Paul's", a recreational facility to be utilized by the community. Portions of the building are proposed to be preserved, with the remaining portions demolished.

The purpose of this Phase I ESA is to identify RECs, CRECs, HRECs and BERs specifically related to the St. Paul's Cathedral Building (hereinafter referred to as the "subject building") and the area immediately north of the subject building which are proposed to be utilized in the future as the Centre at St. Paul's.

1.2 Detailed Scope of Services

This Phase I ESA has been prepared in accordance with procedures established by environmental professionals and in concert with the guidance of regulatory agencies and funding institutions and American Society for Testing and Materials (ASTM) Practice E1527-13, inclusive of the United States Environmental Protection Agency (USEPA) "All Appropriate Inquiry" requirement published in the Federal Register on December 30, 2013. The USEPA "All Appropriate Inquiry" requirement establishes specific regulatory requirements for conducting appropriate inquiries into the

previous ownership, uses, and environmental conditions of a property for the purposes of qualifying for certain landowner liability protections under Comprehensive Environmental Response, Compensation and Liability Act (CERCLA).

The purpose of ASTM Practice E1527-13 is to define good commercial and customary practice in the United States of America for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants within the scope of CERCLA and petroleum products. As such, the practice is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA liability; that is, the practices that constitute *"all appropriate inquiries into the previous ownership and uses of the property consistent with good commercial and customary practice," as defined in 42 U.S.C. §9601 (35)(B).*

As stated in ASTM Practice E1527-13, the purpose of the Phase I ESA is to identify, to the extent feasible, pursuant to the process established by ASTM Practice E1527-13, *"recognized environmental conditions in connection with a property."*

The term "*recognized environmental conditions*," as defined by ASTM Practice E1527-13 means *"the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."*

The term *"de minimis conditions*," as defined by ASTM Practice E1527-13 means "*a condition that generally does not present a threat to human health or the environment that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis conditions are not recognized environmental conditions nor controlled recognized environmental conditions.*"

The term "*controlled recognized environmental condition*," as defined by ASTM Practice E1527-13 means "*a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls. A condition considered by the Environmental Professional to be a controlled recognized environmental condition shall be listed in the findings section of the Phase I Environmental Site Assessment report, and as a recognized environmental conditions in the conclusions section of the Phase I Environmental Site Assessment.*

The term "*historic recognized environmental condition*," as defined by ASTM Practice E1527-13 means "*a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls. Before calling the past release a historical recognized environmental condition, the Environmental Professional must determine whether the past release is a recognized environmental condition at the time the Phase I Environmental Site Assessment is conducted (for example, if there has been a change in the regulatory criteria). If the Environmental Professional considers the past release to be a recognized environmental condition at the time the Phase I Environmental Site Assessment is conducted, the condition shall be included in the conclusions section of the report as a recognized environmental condition.*"

The term "*business environmental risk*," as defined by ASTM Practice E1527-13 means "*a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice. Consideration of business environmental risk issues may involve addressing one or more non-scope considerations.*"

This Phase I ESA, as required by ASTM Practice E1527-13, specifically consists of the following four components:

1. Records Review
    a. Physical settings document review
    b. Regulatory database records search
    c. Local municipal agency records search
    d. Historic use records search
2. Site Reconnaissance
3. Interviews with Past and Present Owners and Occupants
4. Evaluation and Reporting

As stated in Practice E1527-13, there may be environmental issues or conditions at the property, which may be requested by the user to be addressed as part of the Phase I ESA, which are not covered within the scope of ASTM Practice E1527-13. The issues are referred to as non-scope considerations. The following is a list of non-scope considerations, which may be addressed, in a limited capacity within this Phase I ESA:

- Radon
- Lead-Based Paint (LBP)
- Asbestos-Containing Materials (ACM)

- Wetlands
- Special Groundwater Protection Areas
- Mold and Water Damage

1.3 Significant Assumptions

In preparation of the Phase I ESA, it is assumed that information provided within the Environmental Database, regulatory agency records, municipal agency records, as well as information obtained from the user is accurate.

1.4 Limitations and Exceptions

The conclusions presented in this report are professional opinions based on the data described in this report. These opinions have been arrived at in accordance with currently accepted engineering and hydrogeologic standards and practices applicable to this location, and are subject to the following inherent limitations:

1. The data presented in this report are from visual inspections, examination of records in the public domain, and interviews with individuals having information about the site. The passage of time, manifestation of latent conditions, or occurrence of future events may require further exploration of the site, analysis of data, and re-evaluation of the findings, observations, and conclusions presented in this report.

2. The data reported and the findings, observations, and conclusions expressed are limited by the scope of work and defined in ASTM Practice E1527-13. Any deviations from this scope are defined below. Furthermore, the scope of work was defined and developed pursuant to the request of the Client.

3. No warranty or guarantee, whether expressed or implied, is made with respect to the data reported, findings, observations, or conclusions. These are based solely upon site conditions in existence at the time of the investigation, and other information obtained and reviewed by VHB.

4. VHB's Phase I ESA report presents professional opinions and findings of a scientific and technical nature. While attempts were made to relate the data and findings to applicable environmental laws and regulations, the report will not be construed to offer legal opinion or representations as to the requirements of, or compliance with, environmental laws, rules, or regulations, or policies of federal, state, or local government agencies. VHB does not assume liability for financial or other losses or subsequent damage caused by or related to any use of this document.

5. The conclusions presented in this report are professional opinions based on data described in this report. They are intended only for the purpose, site location, and project indicated. This report is not a definitive study of contamination at the site and should not be interpreted as such. An evaluation of subsurface soil and groundwater conditions was not performed as part of this investigation. As at any site, the actual condition of the groundwater and sub-surface soil cannot be determined without further investigation.

6. This report is based, in part, on information supplied to VHB by third-party sources. While efforts have been made to substantiate this third-party information, VHB cannot attest to the completeness or accuracy of information provided by others.

7. The Phase I ESA practice does not include any testing or sampling of materials (e.g., soil, water, air, building materials).

1.5 User Reliance

This report was prepared in July 2019 by Heather Waldmann, CHMM and was supervised by Stephen Kaplan, PG, Director of OHM Services of VHB at the request of the Incorporated Village of Garden City. VHB assumes no liability for use of this report by any person or entity other than the Client, for which it was prepared. Any potential future user of this document would be subject to VHB approval and such user's reliance on this document would be in accordance with the terms and conditions of the original contract.

2.0

Site Description

2.1 Property and Address Location

The overall property consists of one irregular-shaped parcel located on the north side of Stewart Avenue, east of Hampton Road and west of Rockaway Avenue in the Incorporated Village of Garden City, Town of Hempstead, Nassau County, New York. According to information provided by the Nassau County Tax Assessor, the overall property is approximately 48.60 acres in size. The overall property is known by the street address of 295 Stewart Avenue (Appendix A, Figures 1 through 3).

2.1.1 Tax Map Number

The overall property is identified as Section 33 – Block 92 – Lot No. 65 on the Nassau County tax maps (Appendix A, Figure 3).

2.1.2 Ownership

According to the Nassau County tax assessor records, the subject property is currently owned by the Incorporated Village of Garden City.

2.1.3 Title Report

VHB was not provided with a title report for the subject property.

2.1.4 Zoning

According to the Incorporated Village of Garden City Zoning Maps, the site is located within the R-20 (one-family residential) zoning district.

2.2 Current Occupancy and Property Use

Information regarding the current on-site buildings and overall property are provided below.

St. Paul's Cathedral Building

This four-story building with basement is located in the southeastern portion of the overall property. Constructed circa 1883, this is the largest building on the overall property. The basement of this building was observed to consist of utility areas, storage areas, suspected staff living quarters, classrooms, a locker room, food preparation and kitchen support areas, and maintenance areas. Sewer access points were also identified within the basement of the subject building. A cathedral is located on the second floor of the overall building, with the remaining visually inspected portions of the subject building consisting of classrooms, dormitories, common areas, and kitchen areas. This building has been vacant since circa 1991.

Cluett Hall

Cluett Hall was constructed circa 1898 and was originally utilized as a gymnasium. This building is currently occupied by several tenants and was not accessed during the visual inspection.

Field House

The Field House was constructed circa 1962 and is located directly north of Cluett Hall. This building is currently occupied by several tenants and was not accessed during the visual inspection.

Cottages

The cottages are located to the north of the St. Paul's Cathedral Building, and northeast of the Field House and Cluett Hall. The three southernmost cottages were constructed by 1962, and the three northernmost cottages were constructed by 1976. These buildings are currently utilized as the Garden City Recreation Department and Administration Buildings and the interior portions of these buildings were not visually inspected by VHB.

Paved driveways and parking areas are present in the southeastern portion of the overall property, connecting the on-site buildings. In addition, a small playground area is present to the west of the on-site buildings. The northeastern, central and western portions of the overall property are utilized as recreational fields and landscaped areas.

3.0

Site Geology and Hydrogeology

3.1 Geology

A concise and accurate description of the geology, physiography and drainage of Nassau County is found in the Soil Survey of Nassau County, New York (USDA). Relevant excerpts of this study are included below.

Nassau County is part of the Coastal Plain physiographic province. The County is characterized by undulating or rolling landscapes in the northern part and a flat plain with a gently southward tilt in the southern part. A lobe of rolling topography protrudes farther to the south along the eastern edge of the County. Extensive tidal areas and marshes are just south of the plain, and a barrier beach and dunes form the southern outline of the County.

Elevation in the County ranges from sea level to about 340 feet above sea level near the eastern edge of the County, just south of NYS Route 25. The landforms at the higher elevations were deposited as a terminal moraine. These areas have irregular topography that is crossed by deep glacial drainage channels near the north shore. These channels empty into deep bays on the north shore. The steepest relief is along drainage channels or on the side slopes adjacent to the bays.
An outwash plain, which is to the south of the terminal moraine, has a maximum elevation of about 180 feet just northeast of Hicksville and slopes gradually to the south some eight to ten miles, finally reaching tidal area at sea level.

Nassau County is underlain by bedrock, but most of it is at a depth of several hundred feet. The closest surficial bedrock is to the west in the boroughs of Bronx and Queens in New York City and areas to the northwest in Westchester County near Long Island Sound. From these areas of surface exposure, the rock surface dips to the southeast to form a solid basement below Nassau County. Most of the bedrock consists of Cretaceous sedimentary layers. Some of the older rocks in the area are the 200 million year old Triassic red beds and lava flows off New Jersey and Connecticut and Cambrian metamorphic rocks in the New York City area that are 450 million years old.

During the late Cretaceous Period, the sediments from the eroding Appalachian Highlands were carried by streams and rivers to low-lying coastal areas. The sand, silt, and clay of the Raritan and Magothy formations, which form the foundation of Long Island, were deposited as deltas in areas of shallow water. The Raritan formation is below sea level, and the Magothy formation is at the surface of several sites along the north shore. During the Tertiary Period this area of Long Island was uplifted above sea level and the Cretaceous sediments were eroded and dissected by streams and rivers. The valley now occupied by Long Island Sound was cut by a major river, and smaller tributary streams formed valleys which are now the north shore bays.

During the Pleistocene Epoch of the Quaternary Period, several major glacial advances into the northern United States occurred. This epoch is divided into four major glacial stages. From oldest to youngest, they are: Nebraskan, Kansan, Illinoian, and Wisconsinan.

During the Illinoian advance, the ice sheet reached a position just north of the Long Island area. Outwash sand and gravel, of the Jameco gravel formation, was deposited by meltwater streams. Following the Illinoian stage, sea level rose close to its present level and a clay (Gardiner clay) containing marine fossils was deposited in the shallow coastal waters surrounding Long Island.

During the Wisconsinan glacial advance, the ice reached a position represented on most of Long Island by the Ronkonkoma terminal moraine. In the latter part of this stage, the ice sheet receded from a point east of Lake Success and established a new position along the north shore marked by the Harbor Hill terminal moraine. West of Lake Success this lobe of ice overrode the Ronkonkoma moraine and pushed as far south as Staten Island. This caused the terminal moraine/deposits in Nassau County to form a wide band of irregular topography occupying the northern half of the County, while in adjacent Suffolk County the terminal moraine deposits were far enough apart to be two distinct landforms separated by a flat plain. During the Wisconsinan advance, sea level dropped about 350 feet below its current elevation to expose a broad, flat coastal plain.

As the climate again warmed about 11,000 years ago, the Wisconsinan period ended and the Holocene, or present, period began. The ice sheet receded to its present polar limits, and sea level rose to its present level. Currents and wave action modified the outwash plain to create the present-day shoreline.

3.2 Topography and Site Characteristics

3.2.1 Elevation

The topography of the overall property and surrounding area was reviewed from the United States Geological Survey (USGS) 7.5-minute series topographic map for Lynbrook, New York (NY) Quadrangle (see Appendix A, Figure 4). Based upon a review of the aforementioned map and Google Earth imagery, the elevation of the overall property ranges from approximately 91 feet above mean sea level (amsl) to 85 feet amsl with a topographic gradient that slopes gently downward to the southeast. The subject building is located at an elevation of approximately 90 feet amsl.

3.2.2 Soils

According to the Soil Survey of Suffolk County, New York (United States Department of Agriculture [USDA], 1987) (the "Soil Survey"), the soils on the overall property are mapped as Hempstead silt loam (He) and Urban land – Hempstead Complex (Uh). The soils beneath the subject building are mapped as Hempstead silt loam (He). Details of the foregoing soil types are described below.

Hempstead silt loam (He)

This soil is very deep and well drained. It is mostly on plains or along the edges of broad terraces. The areas are square, rectangular, or long and narrow and conform to land-use boundaries in most instances. They range from five acres to long, narrow strips of several hundred acres. Slope ranges from zero-to-three percent.

The typical sequence, depth, and composition of the layers of this soil are as follows:

- Surface layer: Surface to 11 inches, black silt loam.
- Subsurface layer: 11 to 15 inches, dark brown silt loam
- Subsoil: 15 to 29 inches, yellowish brown silt loam. 29 to 33 inches, strong brown very gravelly loamy sand.
- Substratum: 33 to 60 inches or more, very pale brown sand and gravel.

Included with this soil in mapping are small areas of well drained Enfield soils, moderately well drained Mineola soils, and excessively drained to moderately well drained Udipsamments. The Enfield soils make up about 10 percent of the unit. The Mineola soils are in drainage troughs and make up about five percent of the unit. The Udipsamments are in areas where the upper layers of the soil are high in sand content, commonly in material into the surface layer. The Udipsamments make up about five percent of the unit. Also included are a few areas of Hempstead soils with slope of more than three percent along the sides of drainageways.

Soil properties are as follows:

- Permeability: Moderate in the surface layer, subsurface layer, and upper part of the subsoil; rapid in the lower part of the subsoil and very rapid in the substratum.
- Available water capacity: High.
- Soil reaction: Moderately acid to very strongly acid in the surface layer, subsurface layer, and subsoil; strongly acid or very strongly acid in the substratum.
- Surface runoff: Slow.
- Erosion hazard: Slight.
- Water table: At a depth of more than six feet.
- Root zone: To a depth of 40 inches or more.

Practically all areas of this soil are in parks, playgrounds, athletic fields, and golf courses and along the right-of-way of the parkway system. Grass covers most of the areas, and shrubs or trees are on a few areas. Most of the parkway right-of-way is wooded or landscaped with grass and shrubs.

This soil has few limitations as a site for septic effluent disposal. The substratum is a poor filter, causing a hazard of pollution to the groundwater. The frost action is the main limitation of the soil as a site for local streets and roads. Drainage of surface water and use of coarse-grained material for subgrade will reduce the hazard of frost action.

For recreation development, this soil has few limitations. Compaction of intensively used areas increases wetness at the surface and increases erosion.

Although the surface layer mainly is acid, this soil generally has a good natural supply of plant nutrients and available water and is generally suitable for landscaping.

This soil is well suited to open land and woodland wildlife habitat and very poorly suited to wetland wildlife habitat. The proximity of this soil to residential areas and high-speed roadways limits some development of wildlife habitat.

Urban land-Hempstead complex (Uh)

This unit consists of urbanized areas and very deep, well drained soils. It is on nearly level plains. The areas of this unit are variable in shape and are as small as 10 acres, but some areas are as much as 1,000 acres. Slope ranges from zero-to-three percent, but in most areas that are not near drainageways or depressions it is less than two percent. This unit consists of about 75 percent urbanized areas, 20 percent Hempstead soils, and five percent other soils. The urbanized areas and Hempstead soils are so intermingled that it was not practical to map them separately.

The urbanized areas consist of buildings, roads, driveways, parking lots, and other

manmade structures.

The typical sequence, depth, and composition of the layers of Hempstead soils are as follows:

- Surface layer: Surface to 11 inches, black silt loam.
- Subsurface layer: 11 to 15 inches, dark brown silt loam.
- Subsoil: 15 to 29 inches, yellowish brown silt loam. 29 to 33 inches strong brown, very gravelly loamy sand.
- Substratum: 33 to 60 inches or more, very pale brown sand and gravel.

Included with this unit in mapping are small areas of well drained Enfield soils and moderately well drained Mineola soils. The Enfield soils are in areas in which the surface later is lighter colored than in the Hempstead soils. Mineola soils are in low spots where the underling sand and gravel is just beneath the soil surface. Some Hempstead soils along drainageways have slopes of slightly more than three percent.

Properties of the Hempstead soils are as follows:

- Permeability: Moderate in the surface layer, subsurface layer, and upper part of the subsoil; rapid in the lower part of the subsoil and very rapid in the substratum.
- Available water capacity: High.
- Soil reaction: Moderately acid to very strongly acid in the surface layer, subsurface layer, and subsoil; strongly acid or very strongly acid in the substratum.
- Surface runoff: Slow.
- Erosion hazard: Slight.
- Water table: At a depth of more than six feet.
- Root zone: To a depth of 40 inches or more.

The areas on which there are no structures are lawns, gardens, small playgrounds, border strips along streets and sidewalks, and a few vacant lots.

The Hempstead soils have few limitations as a site for dwellings with or without basements, but frost action is a hazard to sidewalks and driveways. Replacing the surface layer and subsoil with coarse-grained material will help to overcome the frost action.

The Hempstead soils have few limitations as a site for septic effluent disposal if enough open area is available. Pollution of the groundwater is a hazard, however, because the substratum is a poor filter for effluent.

Though the Hempstead soils have few limitations as a site for roads and streets or recreation areas, the lack of open space in the unit generally prevents development of such facilities.

The soils have few limitations for landscaping. The surface layer of the soils generally

has a good natural supply of plant nutrients and ample available water capacity.

Because of the urban environment, most areas are not suitable as habitat for wildlife other than songbirds.

A copy of the USDA soil map is included in Appendix C.

3.2.3 Surface Water Bodies

A manmade pond associated with Garden City Golf Club is located approximately 400 feet east of the overall property. The nearest native waterbody is located greater than one mile from the overall property.

3.2.4 Hydrogeologic Zone

The subject property is located within Hydrogeologic Zone I: Deep Flow System (Magothy Recharge Area). Zone I encompasses much of the residential, transport, commercial and industrial activity areas of Nassau and Suffolk Counties. Zone I, located in Nassau County and western Suffolk, contributes water to the middle and lower portions of the Magothy aquifer. Portions of the Glacial aquifer, and to a lesser extent, the Magothy aquifer have been contaminated by nitrates from fertilizers and on-site wastewater disposal systems and by synthetic organic chemicals from industrial and other discharges. Initially, the nitrate contamination was a result of farming practices and then, later, of urbanization. Although the greater part of Zone I is urbanized and subject to contamination, several of the northern sectors are still relatively undeveloped and provide opportunities for clean recharge of the aquifers. Only a small portion of Zone I is sewered (roughly ten percent).

3.2.5 Special Groundwater Protection Areas

Special Groundwater Protection Areas (SGPAs) are significant, largely undeveloped or sparsely developed geographic areas of Long Island that provide recharge to portions of the deep flow aquifer system. They represent a unique, final opportunity for comprehensive, preventive management to preclude or minimize land use activities that can have a deleterious impact on groundwater. Nine SGPAs are located on Long Island: North Hills, Oyster Bay, West Hills/Melville, Oak Brush Plains, South Setauket Woods, Central Suffolk, Southold, South Fork and Hither Hills.

The subject property is not located within an SGPA.

3.3 Groundwater Characteristics

3.3.1 Depth to the Water Table

Estimated groundwater levels and flow directions may vary due to seasonal fluctuations in precipitation, local usage demands, geology, underground structures, or de-watering operations. Generally, groundwater flow typically mimics surface topography and will also tend to flow towards nearby bodies of water. Review of the *USGS Water Table Elevation and Potentiometric-Surface Altitudes in the Upper Glacial, Magothy, and Lloyd Aquifers beneath Long Island, New York, April-May 2013* (see Appendix A, Figure 5), groundwater elevation in the vicinity of the overall property is approximately 52 feet amsl. Based upon a surface elevation that ranges from 85 to 91 feet amsl, the estimated depth to water beneath the overall property is 33 feet to 39 feet below grade surface (bgs). Depth to water beneath the subject building is approximately 38 feet bgs.

A review of well data available from the USGS indicates that the nearest USGS monitoring well (USGS 40000830111) may be located within a parking area on the overall property, approximately 430 feet northwest of the subject building. This well was installed in the Upper Glacial Aquifer to a depth of approximately 49 feet bgs. A total of 292 groundwater measurements have been collected from this well between November 1940 and June 1981 with groundwater elevations ranging from 47.79 feet amsl to 62.25 feet amsl.

3.3.2 Groundwater Flow Direction

Based on a review of the aforementioned water table map (see Appendix A, Figure 5), groundwater flow beneath the subject property is expected to flow to the south-southwest, toward the south shore of Long Island.

3.3.3 Groundwater Classification

Groundwater underlying the subject property and the surrounding area is categorized as Class GA, a source of potable water supply. This classification requires quality standards to be the most stringent. Groundwater underlying Long Island is also designated as a sole source aquifer.

3.3.4 Groundwater Quality

The Nassau County Department of Public Works (NCDPW) has prepared a groundwater data summary report, entitled *Nassau County – Groundwater Monitoring Program 2000-2003, 2005*. The intent of the report was to describe the County's

comprehensive and long standing groundwater program that has been in existence since the 1930s, and present a summary of the extensive amount of data collected through the NCDPW's groundwater monitoring efforts.

The document summarizes groundwater data collected by the NCDPW between 2000 and 2003, and also presents historical information that gives a basis of comparison for the data. As indicated in the study, the main focus of groundwater quality sampling during the 2000 to 2003 period was to determine the presence of volatile organic compounds (VOCs), which are of the most significant countywide groundwater concern.[1] Additionally, certain groundwater samples collected were screened for the presence of pesticides, herbicides, pharmaceuticals, inorganic chemicals and chlorides based upon geographic location (e.g., within areas of current or former agricultural uses, industrial uses, etc.). Other data provided in the document includes groundwater elevations, raw groundwater quality (the quality of untreated groundwater collected from monitoring wells that are not used as a source of public water supply), monthly and annual public water demands as recorded by the numerous water suppliers in Nassau County, and weather-related information.

Based upon a review of Figure 6 in Appendix A, the nearest NCDPW groundwater monitoring well screened in the Northern Atlantic Coastal Plain Aquifer (Well No. N-12257) is located approximately two miles west and crossgradient of the overall property. Based upon the distance, groundwater data associated with this well would not be indicative of groundwater quality beneath the overall property.

[1] It should be noted that not all groundwater quality samples were screened for VOCs, and not all wells identified on Figure 6 have available sample data to reference.

4.0
Site History

4.1 Municipal Records Review

Local government record keeping, pertaining to the subject property being located in the Incorporated Village of Garden City, Town of Hempstead, Nassau County, New York, is under the jurisdiction of the following agencies:

Agency Name	Type of Records Maintained	Date Freedom of Information Request Submitted	Date of Agency Response, Records Review or Records Receipt
Nassau County Tax Assessor	Tax assessment records, parcel/building size, ownership.	NA	Online records reviewed on May 5, 2019.
Village of Garden City Building Department	Building permit applications, building permits, site plans, surveys.	July 16, 2019	Response received on July 23, 2019.
Nassau County Fire Marshal	Fire department and hazardous materials storage violations, registration and testing of underground gasoline and diesel fuel tanks.	July 16, 2019	Response received on July 18, 2019.
Nassau County Department of Health	Registration and testing of underground storage tanks (except gasoline and diesel fuel), registration of chemical and hazardous materials storage facilities, potable water and sanitary disposal facilities, Underground Injection Control Program, lead and asbestos.	July 16 ,2019	Response pending.

Agency Name	Type of Records Maintained	Date Freedom of Information Request Submitted	Date of Agency Response, Records Review or Records Receipt
New York State Department of Environmental Conservation, Region One	Spill Records	May 5, 2019	Records reviewed July 16, 2019.

Summary of Records Reviewed/Obtained as of the Date of Report Issuance

Nassau County Tax Assessor/RealQuest®

VHB reviewed online records available from the Nassau County Tax Assessor on May 5, 2019. The following is a summary of pertinent information obtained from the Nassau County Tax Assessor's website and the RealQuest® Property Detail Report:

Tax Lot:	Section 33 – Block 92 – Lot No. 65
Address:	36 Cathedral Avenue, Garden City
Owner:	Incorporated Village of Garden City
Lot Size:	48.60 acres
Property Class:	963.34 – Village and Public Parks and Recreation Areas

As previously indicated, although the Nassau County Assessor identifies the overall property with a street address of 36 Cathedral Avenue, the site is commonly identified as 295 Stewart Avenue.

Records from the Nassau County Tax Assessor indicate that the overall property is serviced by public water and public sewer systems. These records also indicate that one on-site building was constructed in 1883 (assumed to be the subject building), one building was constructed in 1960 (assumed to be the Field House and/or the Cottages) and one on-site building was constructed in 1969 (assumed to be Ellis Hall).

Incorporated Village of Garden City Building Department

VHB submitted a FOIL application to the Incorporated Village of Garden City Building Department on July 16, 2019. VHB received records on July 23, 2019 and a summary of pertinent records are provided below:

- Building Permit No. 1365 – dated April 11, 1928 to erect one (1) dwelling and one (1) garage. These buildings are assumed to be the buildings formerly located to the northwest of Cluett Hall.
- Building Permit No. 1590 – dated November 14, 1928 to erect a three-car garage. Based upon a review of the aerial photographs, it is assumed that the garage referenced in Building Permit No. 1365, above, may have been constructed as a three-car garage, as no evidence of another stand-alone structure was identified.
- Building Permit No. 8657 – dated April 7, 1957 to erect a four (4) dwellings. The associated Certificate of Occupancy (C/O) No. 7901 was issued on October 4, 1957. It is assumed that these dwellings are the southernmost cottages.
- Building Permit No. 9135 – dated April 1, 1959 to install an elevator. This is assumed to be associated with the elevator within the subject building.
- Building Permit No. 9585 – dated March 14, 1961 to erect a greenhouse. No evidence of a stand-alone greenhouse was observed on the aerial photographs. Based upon the project area usage, it is unlikely that a greenhouse was located within the project area. As such, same is not considered an environmental concern.
- Building Permit No. 9776 – dated January 23, 1962 to erect the Field House.
- Building Permit No. 10561 – dated May 18, 1966 to erect four (4) cottages. Associated C/O No. 9626 was issued on September 19, 1966.
- Building Permit No. 10592 – dated July 7, 1966 to construct an addition (approximately 15-feet x 41-feet) to the Field House.
- Building Permit No. 11172 – dated July 8, 1969 to erect a three-story building (Ellis Hall). The associated C/O was issued on June 17, 1970.
- Building Permit No. 11201 – dated September 2, 1969 to demolish the three-car garage. Based upon a review of the historic aerial photographs, it is assumed that the associated residence was also demolished under this permit.
- Site Plan, dated 1956, by Richard T. Leblie A.I.A., depicts the proposed cottages and indicates that same will be connected to the municipal sewer, located to the east of the subject building.
- Topographic Map of Property, dated June 6, 1970, by Frederick R. Pokorny, depicts St. Paul's School and Ellis Hall on the subject property.

Nassau County Fire Marshal

A FOIL application was submitted to the Nassau County Fire Marshal on July 16, 2019. No response has been received from this agency, to date. A response was received from this agency on July 18, 2019, which noted that the Nassau County Fire Marshal has no records of underground storage tanks, aboveground storage tanks, discharges/releases of petroleum and hazardous materials spills for the subject property.

Nassau County Department of Health

A FOIL application was submitted to the Nassau County Department of Health (NCDH) on July 16, 2019. No response has been received from this agency, to date. Should pertinent records be received which alter the findings or conclusions of this Phase I ESA, same will be forwarded as an addendum.

New York State Department of Environmental Conservation, Region One

The EDR database report (see Section 5.2) identified one New York State Department of Environmental Conservation (NYSDEC) spill incident with the potential to be associated with the overall property. According to the EDR database report, NYSDEC Spill No. 10-07043 is associated with 36 Cathedral Avenue in Garden City. As previously indicated, the Nassau County Tax Assessor records identify both the overall property and a property located approximately one-quarter mile southeast of the overall property with the street address of 36 Cathedral Avenue. Although the overall property is commonly identified by the street address of 295 Stewart Avenue, in an effort to obtain additional information in association with NYSDEC Spill No. 10-07043, on May 5, 2019, VHB submitted a FOIL requests to the NYSDEC. A spill report received from the NYSDEC was reviewed on July 16, 2019. The spill report indicates that Spill No. 10-07043 was reported on September 30, 2010 following the release of approximately five gallons of transformer oil within a transformer vault owned by National Grid and/or LIPA (now PSEG). The spill was issued a letter of no further action on December 30, 2011. No additional information is provided in the EDR database report or the spill record provided by the NYSDEC, and it is unknown if this spill is associated with the overall property or with the site located approximately one-quarter mile southeast of the overall property. However, based upon the minimal quantity released, and as the release occurred within a transformer vault, it is unlikely that this incident presents a significant environmental risk to the overall property.

Adjacent Properties

The EDR database report (see Section 5.2) did not identify any spills on adjacent properties which warranted submission of a FOIL request to the NYSDEC.

4.2 Sanborn Fire Insurance Map Review

EDR was retained to provide historical Sanborn maps of the overall and adjacent properties. Sanborn maps were provided for the years 1925, 1939, 1950, 1961 and 1969 which depict an area in the southeastern portion of the overall property. The

remaining portions of the overall property and adjacent sites are not depicted on the Sanborn maps.

The 1925 through 1961 Sanborn maps depict the westernmost portion of the subject building and Cluett Hall. Cluett Hall is depicted as a gymnasium, and the two buildings are connected via a passageway. In addition, Madison Avenue is depicted to the west of the aforementioned buildings and is likely the present-day paved driveway with parking spaces. The 1969 Sanborn map depicts Cluett Hall as an auditorium, and the Field House has been constructed to the north of Cluett Hall. The Field House is identified on this map as a gymnasium constructed in 1962. No additional information is provided on the Sanborn maps.

A copy of the EDR Historical Sanborn Map search is included in Appendix D.

4.3 Historical Aerial Photograph Review

EDR conducted a search and provided copies of available historical aerial photographs showing the overall property and surrounding properties. VHB reviewed aerial photographs available from EDR (1938, 1940, 1947, 1951, 1953, 1962, 1966, 1976, 1980, 1984, 1994, 2006, 2009, 2013 and 2017) to identify information regarding past uses of the overall property and surrounding properties to determine if historical usage represented an environmental risk. Copies of the EDR Historical Aerial Photograph search are included in Appendix E.

The following is a summary of information provided within the aforementioned historical aerial photographs:

Date	Comments
1938 through 1953	**Overall Property:** The southeastern portion of the overall property is improved with the St. Paul's Cathedral Building (the subject building) and Cluett Hall. A roadway to the west of Cluett Hall and originating at Stewart Avenue traverses the overall property from north to south. In addition, two buildings are present to the northwest of Cluett Hall, along the aforementioned roadway. Based upon the information provided by the Incorporated Village of Garden City Building Department, these buildings are assumed to be a residence and associated garage. Areas immediately surrounding the two aforementioned buildings consist of vegetated areas. The northeast, central and western portions of the overall property consist of landscaped recreational areas, with a baseball diamond and potential running track visible. **Surrounding Properties:** Stewart Avenue is present to the south of the overall property, with moderate residential development beyond. In addition, portions of the existing Garden City school campus are present to the southeast. Areas to the north consist of vacant land. Rockaway Avenue is present to the east of the overall property, with several residences and portions of the existing golf course beyond. Dense residential development is visible to the west of the overall property.

Date	Comments
1962	**Overall Property:** The Field House appears to be under construction to the north of Cluett Hall, and several of the existing cottages have been constructed to the north of the subject building and northeast of the Field House and Cluett Hall. The roadway which previously traversed the site from south to north appears to stop at the northernmost portion of the Field House. The remaining portions of the overall property are consistent with the 1953 aerial photograph depictions. **Surrounding Properties:** A residential development has been constructed to the north of the overall property. The remaining surrounding properties are generally consistent with their 1953 aerial photograph depictions.
1966	**Overall Property:** Construction of the Field House has been completed. The remaining portions of the overall property are consistent with the 1962 aerial photograph. **Surrounding Properties:** The surrounding properties are generally consistent with their 1962 aerial photograph depictions.
1976	**Overall Property:** The remaining cottages have been constructed to the north of the subject building and to the northeast of Cluett Hall and the Field House. In addition, Ellis Hall has been constructed to the east of the subject building. The residence and associated garage to the northwest of Cluett Hall have been demolished. **Surrounding Properties:** Surrounding properties are generally consistent with their 1966 aerial photograph depictions with the exception of visible additions to the Garden City school located southeast of the overall property.
1980 through 1994	**Overall Property:** Additional recreational fields are visible in the northern and northwestern portions of the overall property, and paved driveways have been constructed between the on-site buildings. The remaining portions of the overall property are generally consistent with the 1976 aerial photograph depictions. **Surrounding Properties:** The surrounding properties are generally consistent with their 1976 aerial photograph depictions.
2006 through 2013	**Overall Property:** A larger parking area and a small playground have been constructed to the west of the existing buildings. The remaining portions of the overall property are consistent with their 1994 aerial photograph depictions. **Surrounding Properties:** The surrounding properties are generally consistent with their 1994 aerial photograph depictions.
2017	**Overall Property:** Ellis Hall has been demolished. The remaining portions of the overall property are consistent with their 2013 aerial photograph depictions. **Surrounding Properties:** The surrounding properties are generally consistent with their 2013 aerial photograph depictions.

Based upon a review of historic aerial photographs, the overall property was improved with the subject building and Cluett Hall by 1938, with the northeastern, central and western portions of the overall property consisting of landscaped recreational areas. A roadway to the west of Cluett Hall and originating at Stewart Avenue traversed the overall property from north to south. In addition, a residence and associated garage were present to the northwest of Cluett Hall, along the aforementioned roadway by 1938. In 1962, the Field House was under construction

to the north of Cluett Hall, and several of the existing cottages were constructed to the north of the subject building and northeast of the Field House and Cluett Hall. The roadway which previously traversed the site from south to north appears to stop at the northernmost portion of the Field House by 1962. By 1966, the remaining cottages had been constructed, and by 1969 Ellis Hall was present to the east of the subject building. The residence and associated garage to the northwest of Cluett Hall was demolished between 1966 and 1976. Driveways were added between the on-site buildings and additional recreational fields were visible by 1980. Between 1994 and 2006, a larger parking area and a small playground were constructed to the west of the existing buildings, and between 2013 and 2017 Ellis Hall was demolished.

Surrounding properties to the west have historically consisted of dense residential development. The area to the north of the subject property consisted of vacant land until circa 1962 when a residential development was present. Stewart Avenue was present to the south of the overall property by 1938, with moderate residential development beyond. The existing Garden City school campus has been present to the southeast of the overall property since at least 1938. To the east, Rockaway Avenue has been present since at least 1938, with several residences and a golf course beyond.

4.4 Previous Environmental Reports

No previous environmental reports were provided to VHB as part of this Phase I ESA.

4.5 Activity and Use Limitation

A search was conducted for activity and use limitations (AULs) associated with the subject property, more specifically institutional controls (ICs) and/or engineering controls (ECs), which have been placed upon the overall property as a result of environmental issues identified at the subject property. The search for environmental liens and AULs included a review of information available from the Nassau County Tax Assessor records and the EDR database report.

Based upon a review of the above information, no AULs or environmental liens were identified for the subject property.

4.6 Summary of Site History

Based on reviews of municipal records, Sanborn fire insurance maps, historical aerial photographs and owner-supplied information, the subject building was constructed in the southeastern portion of the overall property circa 1883, with Cluett Hall constructed just west of the subject building circa 1898. Cluett Hall was originally

utilized as a gymnasium. A residence and associated garage were constructed to the northwest of Cluett Hall circa 1928, along a roadway which originated at Stewart Avenue traversed the overall property from north to south. The southernmost cottages were constructed circa 1957, and the Field House was constructed to the north of Cluett Hall circa 1962. By 1962, the roadway which previously traversed the site from south to north appears to stop at the northernmost portion of the Field House. By 1966, the remaining cottages had been constructed, and the residence and associated garage located to the northwest of Cluett Hall were demolished circa 1969. Ellis Hall was constructed to the east of the subject building circa 1969. By 1980, driveways were added between the on-site buildings and additional recreational fields were present. A larger parking area and a small playground were constructed to the west of the existing buildings circa 2006, and Ellis Hall was demolished in 2014. Landscaped, recreational areas have been historically been present on the western, northern and northeastern portions of the overall property.

5.0

Regulatory Agency Database Search

EDR was retained to provide a computerized database search of the project area within an ASTM-standard radius of the subject property (Appendix F). A list of the databases searched and the search radius is shown on the summary table below. VHB reviewed the database output to determine if the subject property appears on any of the regulatory agency lists.

5.1 Federal Databases

Agency	Listing Name or Database Searched	Abbreviation	Search Distance	Subject Property Listed?	No. of Sites within the Search Radius
USEPA	National Priorities List Sites, including Proposed and Delisted Sites	NPL	1.0 mile	No	1 NPL 1 Delisted NPL
USEPA	Superfund Enterprise Management System, including No Further Action Sites	SEMS and SEMS-ARCHIVE	0.5 mile	No	0 SEMS 0 SEMS-ARCHIVE
USEPA	Corrective Action Reports	CORRACTS	1.0 mile	No	0
USEPA	2020 Corrective Action Program List	2020 COR ACTION	0.25 mile	No	0
USEPA	Federal Facility Site Information	FFSI	1.0 mile	No	0
USEPA	Resource Conservation and Recovery Act - Treatment, Storage and Disposal Facilities	RCRA-TSDF	0.5 mile	No	0

Agency	Listing Name or Database Searched	Abbreviation	Search Distance	Subject Property Listed?	No. of Sites within the Search Radius
USEPA	Resource Conservation and Recovery Act - Small/Large Quantity, Conditionally Exempt Small Quantity and Former Hazardous Waste Generators	RCRA SQG/LQG/CESQG/ NonGen	0.25 mile	**Yes**	1 LQG 0 SQG 1 CESQG 0 NonGen
USEPA	Engineering Control Sites	USEC	0.5 mile	No	0
USEPA	Institutional Control Sites	USIC	0.5 mile	No	0
USGS	Department of Defense Sites	DOD	1.0 mile	No	0
USACE	Formerly Used Defense Sites	FUDS	1.0 mile	No	0
USEPA	Brownfields Sites	US Brownfields	0.5 mile	No	0
USDOJ	Superfund (CERCLA) Consent Decrees	CONSENT	1.0 mile	No	0
USEPA	Superfund (CERCLA) Records of Decision	ROD	1.0 mile	No	2
USDOE	Mines Master Index File	UMTRA	0.5 mile	No	0
USDOE	Formerly Utilized Sites Remedial Action Program	FUSRAP	1.0 mile	No	0
USEPA	Open Dump Inventory	ODI	0.5 mile	No	0
US NAVY	Land Use Control Information System	LUCIS	0.5 mile	No	0
USEPA	Mines Master Index File	MINES	0.25 mile	No	0
FEMA	FEMA Underground Tank Database	FEMA-UST	0.25 mile	No	0
USEPA	Fuels Program Registered Listing	FUELS PROGRAM	0.25 mile	No	0

The overall property is identified on the RCRA-NonGen database. RCRA information is the USEPA's comprehensive information and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on-site which generate, transport, store, treat and/or dispose of hazardous waste as defined by RCRA. RCRA no longer regulated hazardous waste generators (RCRA-NonGens) sites do not presently generate hazardous waste. The overall property is identified on the RCRA-NonGen database as "Ellis Hall at Saint Pauls," 295 Stewart Avenue, Garden City. Based upon the information provided in the EDR database report, in 2014, wastes containing polychlorinated biphenyls (PCBs), ignitable wastes, corrosive wastes, reactive wastes, and wastes containing chromium, lead, mercury and silver were generated. Science laboratories were formerly located within Ellis Hall, and Ellis Hall was demolished in 2014. As such, it is assumed that the generated wastes are associated with removal of materials including science laboratory chemicals prior to or during demolition of

this building. There are no reported violations associated with this listing. In addition, as Ellis Hall was constructed in 1969, it is assumed that this building was historically connected to the municipal sewer system and did not utilize on-site sanitary systems. As such, the listing of the overall property on the RCRA-NonGen database due to the generation of the aforementioned wastes is not considered a REC.

In addition to the 21 federal databases with search radii of one-quarter of a mile to one mile, 21 additional federal databases were searched to determine if the subject property was listed. These databases include Federal Superfund Liens (NPL Liens), Emergency Response Notification System (ERNS), Hazardous Material Information Reporting System (HMIRS), Enforcement and Compliance History Information (ECHO), Toxic Chemical Release Inventory System (TRIS), Toxic Substances Control Act (TSCA), TSCA Tracking System (FFTS), Section 7 Tracking System (SSTS), Integrated Compliance Information System (ICIS), Radiation Information Database (RADINFO), Historic FTTS sites (HISTFTTS), US Department of Transportation Incident and Accident Date (DOT OPS), Clandestine Drug Labs (CDL), Historical Clandestine Drug Labs (HCDL), CERCLA Lien information (LE INS2), PCB Activity Database System (PADS), Material License Tracking System (MLTS), Facility Index List (FINDS), RCRA Administrative Action Tracking System (RAATS), PCB Transformer Registration Database (PCBTRD), Coal Ash – DOE (CADOE) and Financial Assurance Information Listing (FAIL). The overall property is identified on the FINDS and ECHO databases.

The FINDS database is a compilation of information contained in several major and minor federal environmental databases. It contains some facility information, but mostly provides leads to the individual databases or other sources which contain more information. EDR includes the following minor databases in the FINDS index: Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS) Facility Subsystem (AFS); environment statute civil and criminal enforcement dockets (DOCKET and C-DOCKET); Federal Underground Injection Control (FURS); Federal Facilities Information System (FFIS); State Environmental Laws and Statues (STATE); and PCB Activity Data System (PADS). The overall property is identified on the FINDS database as "Ellis Hall at Saint Pauls" due to its inclusion on the RCRA-NonGen database. As such, this listing is not considered a REC.

The ECHO database provides integrated compliance and enforcement information for approximately 800,000 facilities in the United States. The overall property is included on the ECHO database as "Ellis Hall at Saint Pauls." There are no violations reported in association with this database listing. As such, same is not considered a REC.

A review of the EDR database report has revealed that there are one NPL site, one delisted NPL site and two ROD sites within one mile; and one RCRA-LQG site and one RCRA-CESQG site within one-quarter mile of the overall property.

National Priorities List (NPL) and Delisted NPL

The NPL database contains a list of sites identified for priority cleanup under the Superfund program. The delisted NPL database includes facilities where no further response is necessary. The one NPL site and one delisted NPL site located within one mile of the overall property are described below:

- Genesco Inc Site 11530, 150 Fulton Avenue, Garden City Park. This NPL site is located approximately 0.54 mile west-northwest of the overall property and crossgradient with respect to groundwater flow direction. According to the information provided in the EDR database report, this facility is a former knotting mill that utilized tetrachloroethene (PCE) in cutting mill operations. During a groundwater investigation conducted by the NCDH beginning in 1991, this site was identified as a potential source of volatile organic compounds (VOCs) in groundwater. Further investigation activities identified PCE in sediments within an on-site drywell. Remediation activities have included the installation of a soil vapor extraction / air sparge (SVE/AS) system which operated until 2001. The EDR database report indicates that the SVE/AS system addressed soil and shallow groundwater impacts. Remediation of off-site groundwater impacts is ongoing. However, based upon the distance of this site from the overall property and its location as crossgradient with respect to groundwater flow direction, this site is unlikely to present a significant environmental risk to the overall property.

- Jackson Steel, 435 First Street, Mineola. This delisted NPL site is located approximately 0.74 mile north of the overall property. According to the EDR database report, this site is a former manufacturing facility that ceased operations in 1991. Subsurface investigation activities conducted at this site identified the presence of PCE, trichloroethene (TCE), 1,1,1-trichloroethene, 1,2-dichloroethylene and 1,1-dichlorothane in on-site drywells and soils at depths of up to 40 feet bgs and in groundwater. Remediation of this site is considered complete with soil concentrations meeting NYSDEC soil standards for commercial use and meeting NYSDEC groundwater standards by 2009. Residual contamination is being managed through a Site Management Plan. Groundwater flow direction beneath this site was determined to be to the southwest. As such, the overall property is located crossgradient with respect to groundwater flow direction. Based upon the distance, the crossgradient location and the remedial status of this site, same is unlikely to present a significant environmental risk to the overall property.

Record of Decision (ROD) Sites

The ROD is a public document that explains the cleanup methods available to a Superfund site. The information included in a ROD is the result of information obtained during the investigation and feasibility phase. The two ROD sites identified in the EDR database report are Geneso Inc Site 11530 and Jackson Steel, which were discussed under their associated NPL and delisted NPL database listings, above.

Based upon the information provided in the EDR database report, these sites are unlikely to present a significant environmental risk to the overall property.

Resource Conservation and Recovery Act – Large Quantity and Conditionally Exempt Small Quantity Hazardous Waste Generators (RCRA-LQG and RCRA-CESQG)

RCRA information is the USEPA's comprehensive information and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on-site which generate, transport, store, treat and/or dispose of hazardous waste as defined by RCRA. RCRA large quantity hazardous waste generators (RCRA-LQGs) generate over 1,000 kilograms (kg) of hazardous waste or over one kg of acutely hazardous waste per month. RCRA conditionally exempt small quantity hazardous waste generators (RCRA-CESQGs) generate less than 100 kg of hazardous waste, or less than one kg of acutely hazardous waste per month. There are no violations reported for the two RCRA facilities identified in the EDR database report, neither site is located adjacent to the overall property and there is no evidence in the EDR database report that suggests these sites present a significant environmental risk to the overall property.

There were no additional federal database listings in the EDR database report.

5.2 New York State Databases

Agency	Listing Name or Database Searched	Abbreviation	Search Distance	Subject Property Listed?	No. of Sites within the Search Radius
NYSDEC	Inactive Hazardous Waste Disposal Sites, including De-listed Sites	SHWS	1.0 mile	No	10 SHWS 0 Del SHWS
NYSDEC	Vapor Intrusion Legacy Site List	VAPOR	1.0 mile	No	0
NYSDEC	Hazardous Substance Waste Disposal Site	HSWDS	0.5 mile	No	0
NYSDEC	Solid Waste Facilities/Landfill Sites	SWF/LF	0.5 mile	No	1
NYSDEC	Registered Recycling Facility List	SWRCY	0.5 mile	No	0
NYSDEC	Registered Waste Tire Storage Facility List	SWTIRE	0.5 mile	No	0
NYSDEC	Leaking Underground Storage Tanks, including Historical LTANKS	LTANKS	0.5 mile	No	25 LTANKS
NYSDEC	Petroleum Bulk Storage - Underground and Aboveground Storage Tank Databases	PBS UST/AST	0.25 mile	**Yes**	8 USTs 3 ASTs
NYSDEC	Chemical Bulk Storage - Underground and Aboveground Storage Tank Databases	CBS UST/AST	0.25 mile	No	0 UST 0 AST
NYSDEC	Major Oil Storage Facility - Underground and Aboveground Storage Tank Databases	MOSF UST/AST	0.5 mile	No	0 UST 0 AST
NYSDEC	Registry of Engineering Controls	NYEC	0.5 mile	No	0
NYSDEC	Registry of Institutional Controls	NYIC	0.5 mile	No	0
NYSDEC	Voluntary Cleanup Agreements	VCP	0.5 mile	No	1
NYSDEC	Environmental Restoration Program	ERP	0.5 mile	No	0
NYSDEC	State Brownfields Site List	Brownfields	0.5 mile	No	0

Agency	Listing Name or Database Searched	Abbreviation	Search Distance	Subject Property Listed?	No. of Sites within the Search Radius
NYSDEC	Spills Information Database, including Historic Spills Database	NYSPILLS	0.125 mile	**Yes**	8 NYSPILLS
NYSDEC	Facility and Manifest Data	MANIFEST	0.25 mile	**Yes**	5
NYSDEC	Registered Drycleaning Facilities	DRYCLEANERS	0.25 mile	No	0
NYSDEC	Coal Ash Disposal Sites List	CADS	0.5 mile	No	0

The overall property is identified on the PBS-UST, NYSPILLS and MANIFEST databases.

Spills Information Database (NYSPILLS)

This database contains information regarding spills reported to the NYSDEC, including chemical and petroleum spills incidents. The NYSPILLS database includes spills active as of April 1, 1986, as well as spills occurring since this date. The EDR database report identified one NYSDEC spill incident with the potential to be associated with the overall property. According to the EDR database report, NYSDEC Spill No. 10-07043 is associated with 36 Cathedral Avenue in Garden City. As previously indicated, the Nassau County Tax Assessor records identify both the overall property and a property located approximately one-quarter mile southeast of the overall property with the street address of 36 Cathedral Avenue. Although the overall property is commonly identified by the street address of 295 Stewart Avenue, in an effort to obtain additional information in association with NYSDEC Spill No. 10-07043, on May 5, 2019, VHB submitted a FOIL requests to the NYSDEC. A spill report received from the NYSDEC was reviewed on July 16, 2019. The spill report indicates that Spill No. 10-07043 was reported on September 30, 2010 following the release of approximately five gallons of transformer oil within a transformer vault owned by National Grid and/or LIPA (now PSEG). The spill was issued a letter of no further action on December 30, 2011. No additional information is provided in the EDR database report or the spill record provided by the NYSDEC, and it is unknown if this spill is associated with the overall property or with the site located approximately one-quarter mile southeast of the overall property. However, based upon the minimal quantity released, and as the release occurred within a transformer vault, it is unlikely that this incident presents a significant environmental risk to the overall property.

Petroleum Bulk Storage – Underground Storage Tanks and Aboveground Storage Tanks (PBS-UST and PBS-AST)

The inclusion of a site on the PBS-UST/AST lists means that the site has one or more registered storage tanks. These databases do not indicate leaks, spills, or other

violations. The overall property is identified on the PBS-UST database as St. Paul's School, 295 Stewart Avenue, Garden City. The EDR database report indicates that the overall property is registered with one UST; however, the capacity, contents and installation details are not provided. During the visual inspection on June 12, 2019, VHB identified one fuel oil UST located to the south of the subject building which is equipped with an overfill alarm. Boilers within the basement of the subject building appeared to be dual-fired natural gas and fuel oil boilers. No evidence of leaks or release were identified in association with the on-site fuel oil UST, and there is no record of release in association with any on-site tanks in the EDR database report. As such, the presence of the fuel oil UST is considered a BER.

Facility Manifest Information (MANIFEST)

The MANIFEST database provides information on hazardous waste shipments and the generators of such shipments, as well as tracking the waste transported and listing the waste disposal facility. The overall property is identified on the MANIFEST database as "Ellis Hall at Saint Pauls," 295 Stewart Avenue. As previously indicated under the overall property's RCRA-NonGen database listing, in 2014, wastes containing PCBs, ignitable wastes, corrosive wastes, reactive wastes, and wastes containing chromium, lead, mercury and silver were generated. Science laboratories were formerly located within Ellis Hall, and Ellis Hall was demolished in 2014. As such, it is assumed that the generated wastes are associated with removal of materials including science laboratory chemicals prior to or during demolition of this building. There are no reported violations associated with this listing. In addition, as Ellis Hall was constructed in 1969, it is assumed that this building was historically connected to the municipal sewer system and did not utilize on-site sanitary systems. As such, the listing of the overall property on the RCRA-NonGen database due to the generation of the aforementioned wastes is not considered a REC.

In addition to the 19 NYS databases with search radii of one-eighth of a mile to one mile, seven additional NYS databases, the New York Spill Liens database (NY LIENS), the State Pollutant Discharge Elimination System (SPDES), Air Emissions Data (AIRS), New York Financial Assurance Information Listing (NYFAIL), Historic Aboveground Storage Tanks (Hist-AST), Historic Underground Storage Tanks (Hist-UST) and Underground Injection Control Wells (UIC) were searched to determine if the subject property was listed. The overall property was not listed on any of the additional 19 NYS databases.

A review of the EDR database report has revealed that there are ten SHWS facilities within one mile; one SWF/LF site, 25 LTANKS sites and one VCP site within one-half mile; eight PBS-UST sites, three PBS-AST sites and five MANIFEST sites within one-quarter mile; and eight NYSPILLS sites within one-eighth mile of the overall property.

New York State Hazardous Waste Sites (SHWS)

The SHWS database is the State's equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous Waste Disposal Sites in New York State. None of the 10 SHWS facilities identified in the EDR database report are located adjacent to the overall property and each is located greater than one-quarter mile from same. In addition, nine of the 10 sites are located crossgradient or downgradient of the overall property, and there is no evidence in the EDR database report that suggests these sites present a significant environmental risk to the overall property. The one upgradient SHWS facility is described below:

- K-Garden City MGP, Hilton Avenue and 11th Street, Garden City, located approximately 0.37 mile east-northeast and upgradient/crossgradient of the overall property. This site is a former gas plant that operated from 1874 to 1906. The site utilized gasoline, rather than coal, to produce natural gas. Site characterization activities identified no contamination on this site which required further action, and the NYSDEC issued a letter of no further action in October 2001. As such, this site is unlikely to present a significant environmental risk to the overall property.

Solid Waste Facilities/Landfill Sites (SWF/LF)

The SWF/LF records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites. The one site identified on the SWF/LF database is Garden City Compost, located approximately 0.24 mile southeast of the overall property and crossgradient with respect to groundwater flow direction. This site is an active composting facility. Based upon the distance and crossgradient location, this site is unlikely to present a significant environmental risk to the overall property.

Leaking Underground Storage Tanks (LTANKS)

LTANKs records contain an inventory of reported leaking storage tank incidents. They can be either leaking underground storage tanks (USTs) or leaking aboveground storage tanks (ASTs). The causes of the incidents are tank test failures, tank failures or tank overfills. The NYSDEC issued a letter of no further action for each of the 25 LTANKS sites listed in the database report and there is no evidence in the EDR database report that suggests these sites present a significant environmental risk to the overall property. In addition, 24 of the 25 LTANKS sites are not located adjacent to the overall property. The one adjacent LTANKS site is summarized as follows:

- NYSDEC Spill Nos. 99-12735 and 99-12752, Depp Residence, 18 Saint Pauls Place, located adjacent to the north and upgradient with respect to groundwater flow direction. According to the information provided in the EDR database report, these two spill numbers are associated with the same incident. The spills were reported on February 8, 2000 due to a fuel oil tank failure. The tank and approximately 1.8 tons of contaminated soil were removed, and the NYSDEC issued a letter of no further action for each of these spill incidents on April 26, 2000. As this release has been remediated, it is unlikely that same presents a significant environmental risk to the overall property.

Voluntary Cleanup Program (VCP)

The VCP was developed by New York to enhance private sector cleanup of brownfield sites by enabling parties to remediate sites using private rather than public funds and to reduce development pressures. The one VCP site identified within one-half mile of the overall property is "St. Marys School," 37 Cathedral Avenue, located approximately 0.43 mile southeast of the overall property and crossgradient with respect to groundwater flow direction. The EDR database report indicates this site is a Class N site, which is a site requiring no further action at this time. As such, and based upon the distance and crossgradient location, it is unlikely that this site presents a significant environmental risk to the overall property.

Petroleum Bulk Storage – Underground Storage Tanks and Aboveground Storage Tanks (PBS-UST and PBS-AST)

The inclusion of a site on the PBS-UST/AST lists means that the site has one or more registered storage tanks. These databases do not indicate leaks, spills, or other violations. There are eight PBS-UST and three PBS-AST facilities listed in the EDR database report. Seven of the eight PBS-UST facilities and the three PBS-AST facilities are not located adjacent to the overall property, and there is no reported evidence that suggests that these sites are a significant environmental risk to the overall property. The one adjacent PBS-UST facility is identified as "Garden City Jr H.S.," Cherry Valley Avenue, located adjacent to the southeast of the overall property and crossgradient with respect to groundwater flow direction. According to the EDR database report, this site is registered with one active, fiberglass reinforced plastic (FRP) UST which was installed in 1988 and is currently in-service. No additional information is provided. However, based upon the location as crossgradient, this tank is unlikely to present a significant environmental risk to the subject property.

Facility Manifest Information (MANIFEST)

The MANIFEST database provides information on hazardous waste shipments and the generators of such shipments, as well as tracking the waste transported and listing the waste disposal facility. Four of the five MANIFEST sites are not located adjacent to the overall property and are unlikely to present a significant environmental risk to same. The one adjacent MANIFEST site is Garden City Public School, 56 Cathedral

Avenue, located adjacent to the southeast of the overall property and crossgradient with respect to groundwater flow direction. The EDR database report indicates that waste oil was removed from this site in 1986. No additional information is provided and there is no evidence in the EDR database report that suggests this site presents a significant environmental risk to the overall property.

New York Spills Information Database (NYSPILLs)

This database contains information regarding spills reported to the NYSDEC, including chemical and petroleum spills incidents. The NYSPILLS database includes spills active as of April 1, 1986, as well as spills occurring since this date. The NYSDEC issued a letter of no further action for each of the eight NYSPILLs sites identified in the EDR database report. In addition, none of the NYSPILLS sites are located adjacent to the overall property and there is no evidence in the EDR database report that suggests these sites present a significant environmental risk to the overall property.

There were no additional state database listings in the EDR database report.

5.3 Tribal Records and EDR Proprietary Databases

Agency	Listing Name or Database Searched	Abbreviation	Search Distance	Subject property Listed?	No. of Sites within the Search Radius
USGS	Indian Reservations	IRESERVE	1.0 mile	No	0
USGS	Indian Reservation - Leaking Underground Storage Tanks	ILTANKS	0.5 mile	No	0
USGS	Indian Reservation - Registered Underground Storage Tanks	IUST	0.25 mile	No	0
USGS	Indian Reservation – Voluntary Cleanup Program Sites	IVCP	0.5 mile	No	0
USGS	Indian Reservation – Open Dump Inventory Sites	IODI	0.25 mile	No	0
EDR	Manufactured Gas Plants	MGP	1.0 mile	No	2
EDR	US Historical Auto Stations	HAS	0.25 mile	No	0
EDR	US Historical Cleaners	HCL	0.25 mile	No	0

The overall property was not identified under the tribal records and EDR proprietary databases.

Two MGP sites were identified within one mile of the overall property.

Manufactured Gas Plant (MGP)

The EDR Proprietary MGP database includes records of coal gas plants compiled by EDR's researchers. MGPs were used in the United States from the 1900s to 1950s to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar, sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as continuous source of soil and groundwater contamination. The two sites identified on the MGP database are summarized as follows:

- LILCO Garden City, Hilton Avenue and 11th Street, Garden City, located approximately 0.37 mile east-northeast and upgradient/crossgradient of the overall property. This site was previously discussed under its associated SHWS database listing. Based upon the information provided in the EDR database report, there was no contamination identified on this site which required further action, and the NYSDEC issued a letter of no further action in October 2001. As

such, this site is unlikely to present a significant environmental risk to the overall property.

- LILCO Hempstead, located approximately 0.91 mile southeast of the overall property and crossgradient with respect to groundwater flow direction. An address is not provided for this site, and there is no information provided in the EDR database report regarding this listing. However, based upon the distance and crossgradient location, it is unlikely that this site presents a significant environmental risk to the overall property.

5.4 Orphan Site Summary

Orphan sites are those sites where due to poor or inadequate address information the location of the property cannot be determined sufficiently for it to be included on the radius map. However, sites with similar street names or zip codes are summarized in the database report as these sites may present environmental risks to the subject property. The Orphan Summary identified three sites with inadequate address information. Based on a review of the Orphan Summary and available address information, it was determined that the listed sites are not located adjacent to the overall property and are unlikely to present a significant environmental concern to the overall property.

6.0

Site Reconnaissance

6.1 Visual Inspection

VHB representatives Heather Waldmann and Stephen Kaplan visually inspected the subject property on June 12, 2019. As previously indicated, the Incorporated Village of Garden City is proposing to repurpose the St. Paul's Cathedral Building (the subject building). The current proposal includes the transformation of this building and the area immediately north into the "Centre at St. Paul's", a recreational facility to be utilized by the community. Portions of the building are proposed to be preserved, with the remaining portions demolished. As such, the visual inspection focused on the subject building and the immediate surrounding area. Interior access was only provided to the St. Paul's Cathedral Building. Information regarding the existing on-site buildings is provided, below.

St. Paul Cathedral Building

Significant damage and deterioration were observed within the subject building. Due to concerns regarding the interior structural integrity of the subject building, the third and fourth floor of the subject building were not accessible and were not visually inspected by VHB. In addition, several areas within the basement of the subject building were inaccessible.

The subject building is a four-story building with basement, located in the southeastern portion of the overall property. Constructed circa 1883, this is the largest building on the overall property. The basement of this building was observed to consist of utility areas, storage areas, suspected staff living quarters, classrooms, a locker room, food preparation and kitchen support areas, and maintenance areas. Sewer access points were also identified within the basement of the subject building. A cathedral is located on the second floor of the overall building, with the remaining visually inspected portions of the subject building consisting of classrooms, dormitories, common areas, and kitchen areas. This building has been vacant since circa 1991.

It should also be noted that a partially above-grade brick structure with a sealed concrete cover was observed to the north of the subject building. It is assumed that this structure is associated with an access point for on-site utilities.

Cluett Hall

Cluett Hall was constructed circa 1898 and was originally utilized as a gymnasium. This building is currently occupied by several tenants and was not accessed during the visual inspection.

Field House

The Field House was constructed circa 1962 and is located directly north of Cluett Hall. This building is currently occupied by several tenants and was not accessed during the visual inspection.

Cottages

The cottages are located to the north of the St. Paul's Cathedral Building, and northeast of the Field House and Cluett Hall. The three southernmost cottages were constructed by 1962, and the three northernmost cottages were constructed by 1976. These buildings are currently utilized as the Garden City Recreation Department and Administration Buildings and the interior portions of these buildings were not visually inspected by VHB.

Paved driveways and parking areas are present in the southeastern portion of the overall property, connecting the on-site buildings. In addition, a small playground area is present to the west of the on-site buildings. The northeastern, central and western portions of the overall property are utilized as recreational fields and landscaped areas.

6.2 Surrounding Land Use

North: Residences along St. Pauls Place.

South: Stewart Avenue, with residential properties and a school beyond.

East: Rockaway Avenue, with residences and a golf course beyond.

West: Residential properties along Hampton Road.

6.3 Interviews

Interior access to the subject building was provided by a representative of the Incorporated Village of Garden City, who identified himself as Tommy. According to the representative of the overall property, the original slate roof was replaced with an asphalt shingle roof in the 1970s. The representative also confirmed the location of the observed fuel oil UST located to the south of the subject building, indicated that the subject building was previously connected to the municipal sewer system and was serviced by public water, and confirmed that the subject building has been vacant since the Incorporated Village of Garden City purchased the site. Additional information provided by the representative is provided in the appropriate section(s) of this Phase I ESA.

6.4 Summary of Environmental Site Features

6.4.1 Hazardous Materials Handling, Storage and Disposal

Storage of various hazardous materials were observed within several areas within the basement of the subject building. These materials included paints, varnishes, cleaning agents such as ammonia, bleach and oven/grill cleaners, strippers and solvents, mastics, and flashing cements. The presence of these materials is considered a BER, and these materials should be removed from the subject building and disposed in accordance with all applicable regulations.

No other evidence of hazardous materials handling, storage and disposal was observed within the subject building during the visual inspection.

6.4.2 Underground and Aboveground Storage Tanks

The overall property is identified on the PBS-UST database as St. Paul's School, 295 Stewart Avenue, Garden City. The EDR database report indicates that the overall property is registered with one UST; however, the capacity, contents and installation details are not provided. During the visual inspection on June 12, 2019, VHB identified one fuel oil UST located to the south of the subject building which is equipped with an overfill alarm. Boilers within the basement of the subject building appeared to be dual-fired natural gas and fuel oil boilers. No evidence of leaks or release were identified in association with the on-site fuel oil UST, and there is no record of release in association with any on-site tanks in the EDR database report. As such, the presence of the fuel oil UST is considered a BER.

Natural gas service was observed on the southern façade of the subject building, and ovens within the basement of the subject building were determined to have previously utilized natural gas.

6.4.3 Utilities and Sanitary and Stormwater Disposal Facilities

Utilities Provided to the Site

- Electricity is available via overhead and underground distribution lines.
- Telephone is available via overhead and underground distribution lines.
- Natural gas service is provided via underground distribution lines.

Sanitary and Stormwater Disposal Systems

- Sanitary wastes generated at the overall property are currently discharged into the municipal sewer system. As the subject building is currently vacant, sanitary wastes are not generated in association with same.
- Stormwater generated on the overall property infiltrates into the ground in unpaved areas and discharges to several on-site storm drains located within the paved parking areas.

Water Supply

- Potable water is provided to the property by the Garden City Village Water District.

6.4.4 Underground Injection Control Program-Regulated Site Features

Underground injection wells are regulated by the UIC Program under the authority of Part C of the Safe Drinking Water Act (SDWA) (42 U.S.C. 300h *et seq.*). The SDWA is designed to protect the quality of drinking water in the United States, and Part C specifically mandates the regulation of underground injection fluids through wells. The USEPA has promulgated a series of UIC regulations under this authority. Recent applicable revisions to UIC regulations were published in the State Implementation Guide - Revisions to the Underground Injection Control Regulations for Class V Injection Wells, September 2000. This document specifically addresses Class V injection wells, which include on-site wastewater disposal features such as drywells, cesspools and in-situ drains. The USEPA issued a Notice of Final Determination for Class V wells; Final Rule on June 7, 2002. With the exception of motor vehicle waste disposal wells and large-capacity cesspools, Class V wells are "authorized by rule" (40 CFR 144.24) and may inject non-hazardous waste as long as the following criteria are met:

- The injection does not endanger underground sources of drinking water (40 CFR 144.12).
- The well owners or operators submit basic inventory information (40 CFR 144.26).

Stormwater runoff generated at the overall property infiltrates into the ground in unpaved areas and discharges into several on-site storm drains located throughout the paved parking areas.

VHB observed numerous floor drains within the basement of the subject building. These drains appeared to be hard-piped and are assumed to have formerly discharged into the municipal sewer system; however, same could not be definitively determined.

As the subject building has been vacant since 1991, sanitary wastes are not currently generated from same. However, the subject building was formerly connected to the municipal sewer system. Based upon the age of the subject building as constructed circa 1883, there is a potential that same formerly utilized an on-site sanitary system and/or leaching beds. Based upon the historic usage of the subject building, it is unlikely that former leaching structures would be impacted, and same is not considered a significant environmental risk.

6.4.5 Potable Water Supply and On-Site Wells

As the subject building is vacant, potable water is not currently supplied to same. However potable water is provided to other buildings on the overall property and was formerly provided to the subject building by the Garden City Village Water District.

6.4.6 Polychlorinated Biphenyls

Polychlorinated biphenyls (PCBs) were used until 1978 and are a group of compounds formed by the chlorination of biphenyl. PCBs have extremely high physical and chemical stabilities which led to their being used in many applications, including heat transfer fluids, hydraulic fluids, and dielectrics. PCBs are often found in transformers, capacitors and hydraulic systems.

Electrical equipment containing PCBs are still in use and can pose a serious health hazard if fluids come in direct contact with humans, soil or groundwater. Fires involving electrical equipment containing PCBs can cause the material to be dispersed over a large area and potentially expose many people to a health risk. Because of the health hazard associated with PCBs, they are regulated under the Toxic Substances Control Act (TSCA).

One elevator was identified within the subject building. This elevator is assumed to be hydraulic-driven. However, VHB was unable to locate a mechanical room in association with the elevator to confirm same. It should be noted that several areas within the basement of the subject building were inaccessible. Based upon the age of the subject building as constructed circa 1883, there is a potential for hydraulic fluid associated with the aforementioned elevator, if present, to contain PCBs. In addition, based upon the age of the subject building, building materials including window caulking, fluorescent light ballasts, and mastic materials have the potential to contain PCBs. The potential presence of PCBs within building materials and in association with a potential hydraulic elevator is considered a BER.

6.4.7 Debris, Dumping and Surficial Staining

As previously indicated, interior damage and deterioration was observed within the subject building. No evidence of dumping or surficial staining was observed within the subject building during the visual inspection.

6.4.8 Stressed Vegetation

No stressed vegetation was present at the time of inspection.

6.4.9 Soil Vapor Migration and Encroachment

VHB conducted a Tier 1 vapor encroachment screen in accordance with ASTM E2600-10 *Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions*. The ASTM E2600-10 guidance provides, "*…practical guidance and a useful process for conducting a vapor encroachment screen (VES) on a property parcel involved in a real estate transaction in the United States of America with respect to chemicals of concern (COC) that may migrate as vapors onto a property as a result of contaminated soil and groundwater on or near the property*."

The goal of the VES, as established by the ASTM E2600-10 is to, "*…identify a vapor encroachment condition (VEC) which is the presence of likely presence of COC vapors in the sub-surface of the target property caused by the release of vapors from contaminated soil or groundwater either on or near the target property…*"

The Tier 1 screening included a review of the following:

- Available regulatory data (i.e. historical aerial photographs, historical Sanborn maps and the EDR database report [see Section 5.0]).
- A review of municipal records, including NYSDEC spill records.
- Current and historical usage of the subject property and surrounding areas.

- Depth to groundwater and groundwater flow direction in the vicinity of the subject property.
- Soil characteristics in the vicinity of the subject property.
- Preferential pathways.
- Current remedial status of any contaminated properties.
- Soil and groundwater sampling from VHB's concurrent Phase II ESA (Phase II ESA report pending and to be provided under separate cover).

Based upon a review of the aforementioned sources, a VEC is unlikely to exist at the overall property.

6.4.10 Guano

Excrement deposits from birds and bats roosting in towers, steeples, walkways, or attics can create a health hazard for building occupants, visitors, employees and building service workers. When excrement dries (becomes friable), the organisms therein can travel as airborne contaminants. Inhalation of the dust from infected droppings or feathers can result in pulmonary infections.

Significant bird guano was observed throughout the subject building, as well as active nesting areas and eggshells. Same is considered a BER. In addition, various decomposing animals were observed within the subject building.

7.0

Non-Scope Considerations

7.1 Radon

Radon is a colorless, radioactive, inert gas formed by the decay of radium and may be present in soils and rocks containing granite, shale, phosphate and pitchblende. The USEPA's Map of Radon Zones for New York State, September 1993, indicates that the Garden City area in general is not a radon risk area. The October 2018 New York State Department of Health (NYSDOH) radon survey indicates that 792 radon tests have been conducted in Nassau County with average radon basement concentrations of 1.50 picoCuries per liter (pCi/L), which is below the USEPA action level of 4.0 pCi/L USEPA.

Additional data (October 2018) obtained from the NYSDOH indicates that 377 basement radon tests have been conducted in the Town of Hempstead Nassau County, with an average radon basement concentration of 1.23 pCi/L. Based on these data, radon does not likely represent an environmental concern for the overall property.

7.2 Lead-Based Paint

In 1978, the U.S. Product Safety Commission issued a ban on paints or surface coatings that contain greater than 0.06 percent lead. A visual inspection of painted surfaces was conducted during the site inspection. Painted surfaces within the subject building were observed to be in poor condition with significant peeling and chipping.

Based upon the age of the subject building as constructed circa 1883, it is likely that lead-based paint is present within the subject building. Due to the prolonged vacant and unoccupied status of the subject building, painted surfaces were generally in poor condition. Same is considered a BER.

7.3 Asbestos-Containing Materials

Asbestos is the name given to a group of fibrous silicate minerals, typically those of the serpentine group. The tensile strength, flexibility, and non-flammability of asbestos have led to many uses including structural materials, brake linings, insulation, and pipe manufacture. Asbestos is of concern as an air pollutant because when inhaled it may cause asbestosis, mesothelioma, and bronchogenic carcinoma. In 1989, the USEPA announced regulations that would phase out most uses of asbestos by 1996.

Based upon the age of the subject building as constructed circa 1883, there is a potential for asbestos containing materials (ACM) to be present. Although abatement of some areas of ACM were apparent during the visual inspection, VHB observed suspect ACM pipe insulation within various areas of the subject building's basement, and mastic suspected to contain asbestos was observed in association with ceiling tiles and classroom chalkboards. Labels on several containers of mastic materials within the basement of the subject building confirmed that same contain asbestos. In addition, other building materials, including floor tiles and roofing materials, within the subject building have the potential to contain ACM. Due to deterioration and structural damage to the upper floors of the subject building, VHB did not access the rooftop during the visual inspection. However, as a majority of the rooftop is gabled, portions of the rooftop were visible from outside the subject building, and a representative of the overall property indicated that the original slate roof of the subject building was replaced with an asphalt shingle roof in the 1970s. Asphalt shingle roofing materials have the potential to contain ACM. The potential presence of ACM within the subject building and within roofing materials is considered a BER.

7.4 Wetlands

Pursuant to 6 NYCRR Part 661, the NYSDEC regulates various uses and activities within NYS-regulated tidal wetlands and the surrounding 300-foot adjacent area. The NYSDEC Tidal Wetlands Maps (available online at www.twi.ligis.org) depict the approximate boundaries of tidal wetlands under NYSDEC jurisdiction. According to NYSDEC Tidal Wetlands Maps, there are no NYSDEC tidal wetlands located within one-mile of the overall property.

Pursuant to 6 NYCRR Parts 663 and 664, the NYSDEC regulates various uses and activities within NYS-regulated freshwater wetlands and the surrounding 100-foot adjacent area. The NYSDEC Environmental Resource Mapper (ERM) website (available online at http://www.dec.ny.gov/imsmaps/ERM/viewer.htm) and the NYSDEC Freshwater Wetland Maps depict the approximate boundaries of freshwater wetlands under NYSDEC jurisdiction. According to the ERM website there are no NYS-regulated freshwater wetlands located within one-mile of the overall property.

The United States Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) Wetlands Mapper website (available online at http://www.fws.gov/wetlands/Data/Mapper.html) depicts the approximate boundaries of wetlands that may be regulated by the federal government. In general, any proposed direct impact to federally-regulated wetlands (e.g., draining, filling, dredging, discharges, outfalls, construction of structures, etc.) requires a permit from the United States Army Corps of Engineers (USACE). According to the NWI website, the closest potential federally-regulated wetlands are located approximately 400 feet east of the overall property. These wetlands are associated with a manmade pond within the Garden City Golf Club property, and are classified as PUBHx wetlands, which are defined as palustrine water bodies with an unconsolidated bottom, which have been excavated and are permanently flooded. Additional information obtained from the FWS website is included in Appendix C.

Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMs) were reviewed to determine if the subject property is located within the 100-year or 500-year flood zones. The FIRM showing the subject property (No. 36059C0210G) is not printed, which indicates that the entire property is located outside the 100-year and 500-year flood zones and that there is a minimal risk of flooding at the overall property.

7.5 Mold and Water Damage

Concern about indoor exposure to mold has been increasing as the public becomes aware that exposure to mold can cause a variety of health effects and symptoms, including allergic reactions. Molds can be found almost anywhere; they can grow on virtually any organic substance, as long as moisture and oxygen are present. There are molds that can grow on wood, paper, carpet, foods, sheetrock, plaster and insulation. When excessive moisture accumulates in buildings or on building materials, mold growth will often occur, particularly if the moisture problem remains undiscovered or unaddressed.

Visual evidence of water damage and potential mold/mildew was observed throughout various areas of the subject building. In addition, several areas of significant damage to the rooftop of the subject building was observed, indicating that water intrusion is an active and ongoing issue. The water damage and potential mold/mildew within the subject building is considered a BER.

8.0 Findings

This document is a Phase I ESA prepared to determine RECs, CRECs, HRECs and/or BERs in connection with a portion of the property formerly utilized as the St. Paul's School, located on the north side of Stewart Avenue, between Hampton Road to the west and Rockaway Avenue to the east, in the Incorporated Village of Garden City, Town of Hempstead, Nassau County, New York (the "overall property"). The overall property is identified as Section 33 – Block 92 – Lot No. 65 on the Nassau County tax maps. The Nassau County Tax Assessor records indicate that the overall property is identified by the street address of 36 Cathedral Avenue; however, this street address is also associated with a property located to the southeast, and the overall property is commonly known by the street address of 295 Stewart Avenue. For the purposes of this Phase I ESA, the overall property is identified with the street address of 295 Stewart Avenue.

The overall property is improved with numerous buildings formerly utilized in association with the St. Paul's School. The St. Paul's School began operating in the 1890s as an endowed Episcopal School and closed in 1991, following a bankruptcy in the Episcopal Diocese. The Village of Garden City purchased the property in 1993. The buildings associated with the overall property are described below:

St. Paul's Cathedral Building

This four-story building with basement is located in the southeastern portion of the overall property. Constructed circa 1883, this is the largest building on the overall property. The basement of this building was observed to consist of utility areas, storage areas, suspected staff living quarters, classrooms, a locker room, food preparation and kitchen support areas, and maintenance areas. Sewer access points were also identified within the basement of the subject building. A cathedral is located on the second floor of the overall building, with the remaining visually inspected portions of the subject building consisting of classrooms, dormitories, common areas, and kitchen areas. This building has been vacant since circa 1991.

Ellis Hall
This building was constructed circa 1969 and was formerly utilized as a library and science building. Ellis Hall was located to the east of the St. Paul's Cathedral Building and was demolished in 2014 due to concerns related to mold and asbestos.

Cluett Hall
Cluett Hall was constructed circa 1898 and was originally utilized as a gymnasium. This building is currently occupied by several tenants.

Field House
The Field House was constructed circa 1962 and is located directly north of Cluett Hall. This building is currently occupied by several tenants.

Cottages
The cottages are located to the north of the St. Paul's Cathedral Building, and northeast of the Field House and Cluett Hall. The three southernmost cottages were constructed by 1962, and the three northernmost cottages were constructed by 1976. These buildings are currently utilized as the Garden City Recreation Department and Administration Building.

Paved driveways and parking areas are present in the southeastern portion of the overall property, connecting the on-site buildings. In addition, a small playground area is present to the west of the on-site buildings. The northeastern, central and western portions of the overall property are utilized as recreational fields and landscaped areas.

The Incorporated Village of Garden City is proposing to repurpose the St. Paul's Cathedral Building. The current proposal includes the transformation of this building and the area immediately north into the "Centre at St. Paul's", a recreational facility to be utilized by the community. Portions of the building are proposed to be preserved, with the remaining portions demolished.

The purpose of this Phase I ESA is to identify RECs, CRECs, HRECs and BERs specifically related to the St. Paul's Cathedral Building (the "subject building") and the area immediately north of the subject building which are proposed to be utilized in the future as the Centre at St. Paul's.

The elevation of the overall property ranges from approximately 91 to 85 feet amsl. The topographic gradient of the overall property slopes gently downward to the southeast. The subject building is located at an elevation of approximately 90 feet amsl. Groundwater elevation in the vicinity of the overall property is approximately 52 feet amsl. Based upon a surface elevation of 91 to 85 feet amsl, estimated depth to groundwater beneath the overall property is approximately 33 to 39 feet bgs. Depth to water beneath the subject building is approximately 38 feet bgs.

Groundwater beneath the subject property is expected to flow to the south-southwest, toward the south shore of Long Island.

Based on reviews of municipal records, Sanborn fire insurance maps, historical aerial photographs and owner-supplied information, the subject building was constructed in the southeastern portion of the overall property circa 1883, with Cluett Hall constructed just west of the subject building circa 1898. Cluett Hall was originally utilized as a gymnasium. A residence and associated garage were constructed to the northwest of Cluett Hall circa 1928, along a roadway which originated at Stewart Avenue traversed the overall property from north to south. The southernmost cottages were constructed circa 1957, and the Field House was constructed to the north of Cluett Hall circa 1962. By 1962, the roadway which previously traversed the site from south to north appears to stop at the northernmost portion of the Field House. By 1966, the remaining cottages had been constructed, and the residence and associated garage located to the northwest of Cluett Hall were demolished circa 1969. Ellis Hall was constructed to the east of the subject building circa 1969. By 1980, driveways were added between the on-site buildings and additional recreational fields were present. A larger parking area and a small playground were constructed to the west of the existing buildings circa 2006, and Ellis Hall was demolished in 2014. Landscaped, recreational areas have been historically been present on the western, northern and northeastern portions of the overall property.

Surrounding properties to the west have historically consisted of dense residential development. The area to the north of the subject property consisted of vacant land until circa 1962 when a residential development was present. Stewart Avenue was present to the south of the overall property by 1938, with moderate residential development beyond. The existing Garden City school campus has been present to the southeast of the overall property since at least 1938. To the east, Rockaway Avenue has been present since at least 1938, with several residences and a golf course beyond.

The overall property is identified on the RCRA-NonGen database and the MANIFEST database as "Ellis Hall at Saint Pauls," 295 Stewart Avenue, Garden City. Based upon the information provided in the EDR database report, in 2014, wastes containing PCBs, ignitable wastes, corrosive wastes, reactive wastes, and wastes containing chromium, lead, mercury and silver were generated. Science laboratories were formerly located within Ellis Hall, and Ellis Hall was demolished in 2014. As such, it is assumed that the generated wastes are associated with removal of materials including science laboratory chemicals prior to or during demolition of this building. There are no reported violations associated with this listing. In addition, as Ellis Hall was constructed in 1969, it is assumed that this building was historically connected to the municipal sewer system and did not utilize on-site sanitary systems. As such, the listing of the overall property on the RCRA-NonGen database due to the generation of the aforementioned wastes is not considered a REC.

The overall property is also included on the FINDS and ECHO databases due to its inclusion on the RCRA-NonGen database.

The EDR database report identified one NYSDEC spill incident with the potential to be associated with the overall property. According to the EDR database report, NYSDEC Spill No. 10-07043 is associated with 36 Cathedral Avenue in Garden City. As previously indicated, the Nassau County Tax Assessor records identify both the overall property and a property located approximately one-quarter mile southeast of the overall property with the street address of 36 Cathedral Avenue. Although the overall property is commonly identified by the street address of 295 Stewart Avenue, in an effort to obtain additional information in association with NYSDEC Spill No. 10-07043, on May 5, 2019, VHB submitted a FOIL requests to the NYSDEC. A spill report received from the NYSDEC was reviewed on July 16, 2019. The spill report indicates that Spill No. 10-07043 was reported on September 30, 2010 following the release of approximately five gallons of transformer oil within a transformer vault owned by National Grid and/or LIPA (now PSEG). The spill was issued a letter of no further action on December 30, 2011. No additional information is provided in the EDR database report or the spill record provided by the NYSDEC, and it is unknown if this spill is associated with the overall property or with the site located approximately one-quarter mile southeast of the overall property. However, based upon the minimal quantity released, and as the release occurred within a transformer vault, it is unlikely that this incident presents a significant environmental risk to the overall property.

During the visual inspection on June 12, 2019, significant damage and deterioration were observed within the subject building. Due to concerns regarding the interior structural integrity of the subject building, the third and fourth floor of the subject building were not accessible and were not visually inspected by VHB. In addition, several areas within the basement of the subject building were inaccessible.

A partially above-grade brick structure with a sealed concrete cover was observed to the north of the subject building. It is assumed that this structure is associated with an access point for on-site utilities.

Storage of various hazardous materials were observed within several areas within the basement of the subject building. These materials included paints, varnishes, cleaning agents such as ammonia, bleach and oven/grill cleaners, strippers and solvents, mastics, and flashing cements. The presence of these materials is considered a BER, and these materials should be removed from the subject building and disposed in accordance with all applicable regulations.

The overall property is identified on the PBS-UST database as St. Paul's School, 295 Stewart Avenue, Garden City. The EDR database report indicates that the overall property is registered with one UST; however, the capacity, contents and installation details are not provided. During the visual inspection on June 12, 2019, VHB identified one fuel oil UST located to the south of the subject building which is

equipped with an overfill alarm. Boilers within the basement of the subject building appeared to be dual-fired natural gas and fuel oil boilers. No evidence of leaks or release were identified in association with the on-site fuel oil UST, and there is no record of release in association with any on-site tanks in the EDR database report. As such, the presence of the fuel oil UST is considered a BER.

Stormwater runoff generated at the overall property infiltrates into the ground in unpaved areas and discharges into several on-site storm drains located throughout the paved parking areas.

VHB observed numerous floor drains within the basement of the subject building. These drains appeared to be hard-piped and are assumed to have formerly discharged into the municipal sewer system; however, same could not be definitively determined.

As the subject building has been vacant since 1991, sanitary wastes are not currently generated from same. However, the subject building was formerly connected to the municipal sewer system. Based upon the age of the subject building as constructed circa 1883, there is a potential that same formerly utilized an on-site sanitary system and/or leaching beds. Based upon the historic usage of the subject building, it is unlikely that former leaching structures would be impacted, and same is not considered a significant environmental risk.

One elevator was identified within the subject building. This elevator is assumed to be hydraulic-driven. However, VHB was unable to locate a mechanical room in association with the elevator to confirm same. It should be noted that several areas within the basement of the subject building were inaccessible. Based upon the age of the subject building as constructed circa 1883, there is a potential for hydraulic fluid associated with the aforementioned elevator, if present, to contain PCBs. In addition, based upon the age of the subject building, building materials including window caulking, fluorescent light ballasts, and mastic materials have the potential to contain PCBs. The potential presence of PCBs within building materials and in association with a potential hydraulic elevator is considered a BER.

Significant interior damage and deterioration was observed within the subject building. No evidence of dumping or surficial staining was observed within the subject building during the visual inspection.

Significant bird guano was observed throughout the subject building, as well as active nesting areas and eggshells. Same is considered a BER. In addition, various decomposing animals were observed within the subject building.

Based upon the age of the subject building as constructed circa 1883, it is likely that lead-based paint is present within the subject building. Due to the prolonged vacant and unoccupied status of the subject building, painted surfaces were generally in poor condition. Same is considered a BER.

Based upon the age of the subject building as constructed circa 1883, there is a potential for ACM to be present. Although abatement of some areas of ACM were apparent during the visual inspection, VHB observed suspect ACM pipe insulation within various areas of the subject building's basement, and mastic suspected to contain asbestos was observed in association with ceiling tiles and classroom chalkboards. Labels on several containers of mastic materials within the basement of the subject building confirmed that same contain asbestos. In addition, other building materials, including floor tiles and roofing materials, within the subject building have the potential to contain ACM. Due to deterioration and structural damage to the upper floors of the subject building, VHB did not access the rooftop during the visual inspection. However, as a majority of the rooftop is gabled, portions of the rooftop were visible from outside the subject building, and a representative of the overall property indicated that the original slate roof of the subject building was replaced with an asphalt shingle roof in the 1970s. Asphalt shingle roofing materials have the potential to contain ACM. The potential presence of ACM within the subject building and within roofing materials is considered a BER.

Visual evidence of water damage and potential mold/mildew was observed throughout various areas of the subject building. In addition, several areas of significant damage to the rooftop of the subject building was observed, indicating that water intrusion is an active and ongoing issue. The water damage and potential mold/mildew within the subject building is considered a BER.

The subject property does not appear in listings, databases or registries of Superfund sites, CERCLIS sites, hazardous waste treatment facilities, known or suspected hazardous waste disposal sites or landfills maintained by the USEPA or NYSDEC.

9.0
Conclusions

Based on the results of the site inspection, records review and interviews, no RECs were identified in connection with the subject building. Several BERs were identified, which are summarized below:

- Storage of various hazardous materials were observed within several areas within the basement of the subject building. These materials included paints, varnishes, cleaning agents such as ammonia, bleach and oven/grill cleaners, strippers and solvents, mastics, and flashing cements. The presence of these materials is considered a BER, and these materials should be removed from the subject building and disposed in accordance with all applicable regulations.

- An out-of-service fuel oil UST is present to the south of the subject building. Same is considered a BER.

- The potential presence of PCBs within building materials and in association with a potential hydraulic elevator is considered a BER.

- The potential presence of ACM within the subject building and within roofing materials is considered a BER.

- The water damage and potential mold/mildew within the subject building is considered a BER.

- Significant bird guano was observed throughout the subject building, as well as active nesting areas and eggshells. Same is considered a BER.

10.0

Environmental Professional Statement

This Phase I ESA has been prepared in accordance with procedures established by environmental professionals and in concert with the guidance of regulatory agencies and funding institutions, ASTM Practice E1527-13, inclusive of the United States Environmental Protection Agency (USEPA) "All Appropriate Inquiry" requirement published in the Federal Register on December 30, 2013. The USEPA "All Appropriate Inquiry" requirement establishes specific regulatory requirements for conducting all appropriate inquiries into the previous ownership, uses, and environmental conditions of a property for the purposes of qualifying for certain landowner liability protections under CERCLA.

VHB, declares that, to the best of its professional knowledge and belief, it meets the definition of "Environmental Professional" as set forth in 312.10 of 40 CFR 312 and it has the specific qualifications based on education, training and experience to assess a property with respect to the nature, history and setting of the subject property.

VHB has developed and performed the "All Appropriate Inquiries" in conformance with the standards and practices set forth in 40 CFR Part 312.

Section 11.0 contains the data gaps and deficiencies of the research data encountered during VHB's preparation of this report.

11.0

Data Gaps/Data Failure

As stated within this document, the Phase I ESA was conducted in accordance with requirements set forth in the ASTM Practice E1527-13 and USEPA All Appropriate Inquiry Rule. Based upon VHB's research in an attempt to satisfy all the requirements set forth in the above-referenced standards, the following data gaps were encountered:

- FOIL responses have not been received from the Incorporated Village of Garden City, the NCDH, and the NCFM.
- Information regarding the existing fuel oil tank is unknown.
- Several areas of the subject building were inaccessible during the visual inspection.

Re: FOIL Request

Dear Mr. Qurashi:

This letter acknowledges receipt of your Freedom of Information Law request received today whereby you seek access to Village records pertaining to 295 Stewart Avenue. A search of the Village's files is being performed and further response should be ready within twenty (20) days of the date of this letter. You will be advised whether your request is granted or denied, in whole or in part, whether a search of the Village files has revealed no records responsive to your request, or whether additional time is needed to search for responsive records.

If you have any questions, please feel free to contact Denise Ostapow at (516) 465-4052 or via email at dostapow@gardencityny.net.

Sincerely,

Karen M. Altman
Village Clerk

To: Qurashi, Mohammad
Subject: [External] Nassau County FOIL - DO NOT REPLY

Dear Mohammad Qurashi,

Below is a copy of the foil request you have recently submitted for your records:

FOIL Reference Number: 111048

Department:	Fire Commission - Hazardous Materials Division
Requested Records:	History of tank registration (underground and aboveground), documentation regarding the storage or handling of chemical or toxic materials and flammables, inspection and violation reports for the site located on: 295 Stewart Avenue, Garden City, NY 11530 Section - 33, Block - 092, Lot - 65 If possible, please email any findings to mqurashi@vhb.com

First Name:	Mohammad	Last Name:	Qurashi	
Address:	100 Motor Parkway, Suite 135, Hauppauge NY 11788			
City:	Hauppauge	State:	NY	Zip: 11788
Email Address:	mqurashi@vhb.com			
Phone Number:	(631) 787-3400			

You have thirty (30) business days from receipt of a denial of access to records to appeal to:

FOIL APPEALS OFFICER
COUNTY OF NASSAU
OFFICE OF THE COUNTY ATTORNEY
Ralph G. Caso Executive & Legislative Building
One West Street
Mineola, New York 11501-4820

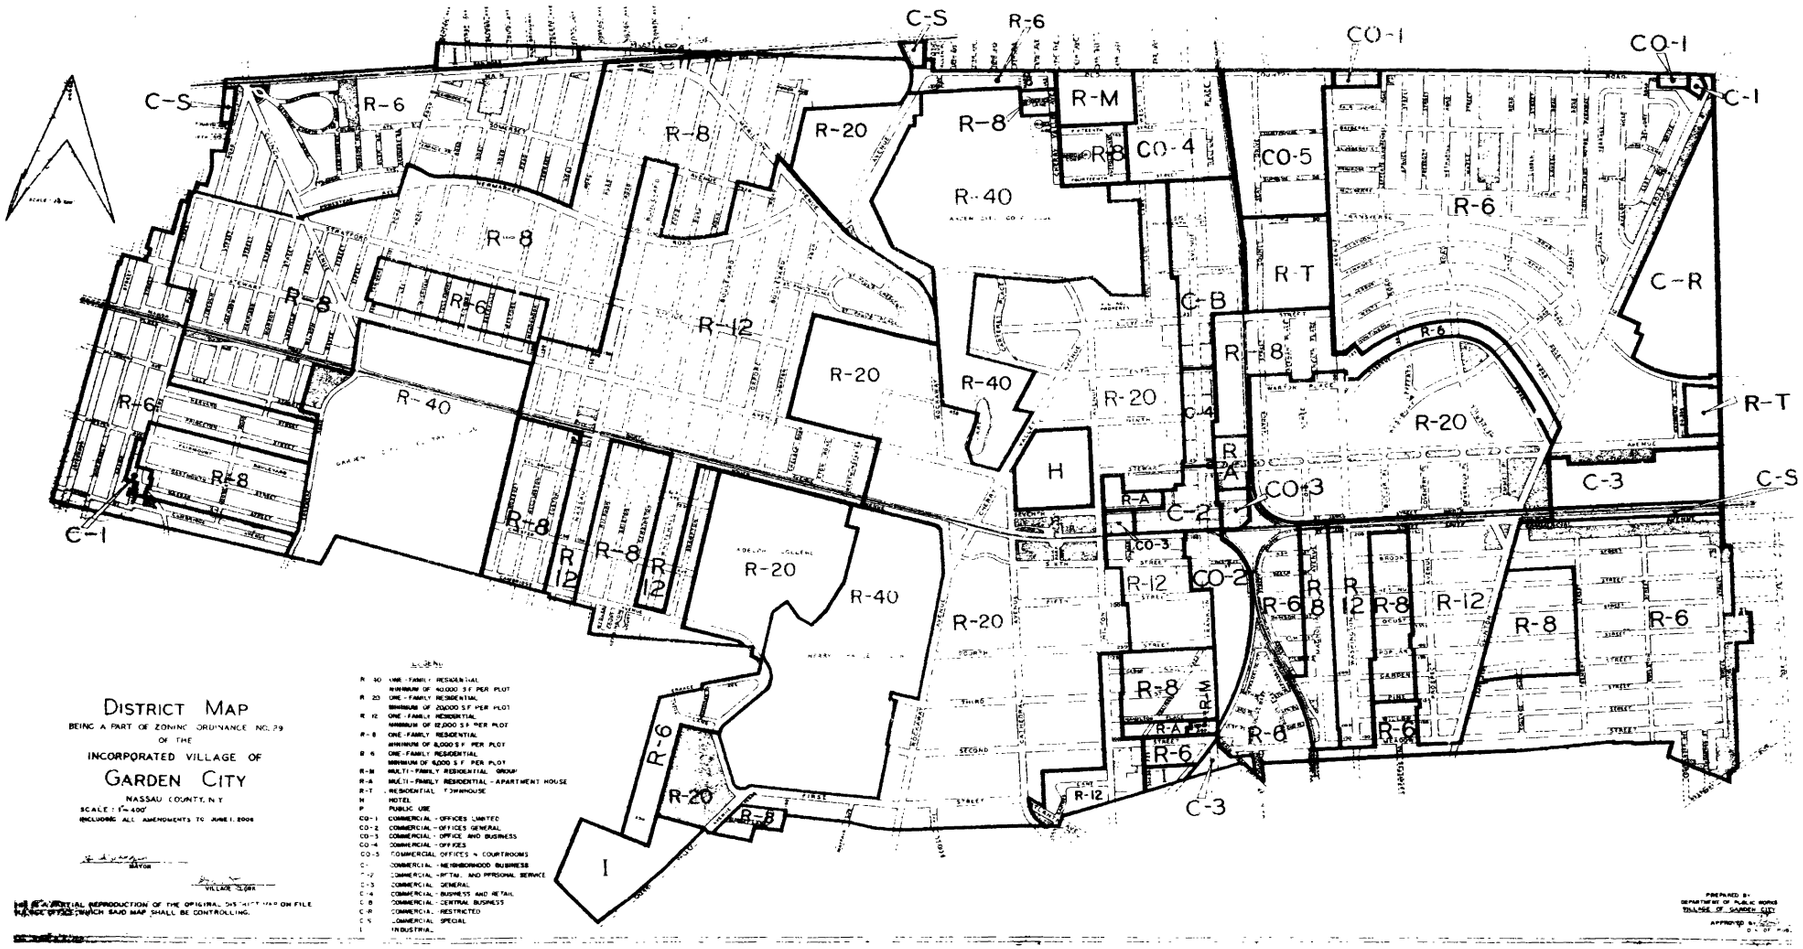

Qurashi, Mohammad

From: FC.FOIL@nassaucountyny.gov
Sent: Thursday, July 18, 2019 3:27 PM
To: Qurashi, Mohammad
Subject: [External] Reference #: 111048 - 295 STEWART AVE, GARDEN CITY, NY, 11530

A courtesy search of the Nassau County Fire Marshal records indicates that there is no record of underground storage tanks, above ground storage tanks, discharges/releases of petroleum and hazardous materials spills.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Nassau County, New York
Survey Area Data: Version 15, Sep 3, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Dec 31, 2009—Oct 5, 2016

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
He	Hempstead silt loam	45.5	95.4%
Uh	Urban land-Hempstead complex	2.2	4.6%
Totals for Area of Interest		**47.7**	**100.0%**

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Vanasse Hangen Brustlin, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 03/11/2019 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Federal Delisted NPL site list

Delisted NPL: The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may deleted from the NPL where no further response is appropriate.

A review of the Delisted NPL list, as provided by EDR, and dated 03/11/2019 has revealed that there is 1 Delisted NPL site within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/25/2019 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/25/2019 has revealed that there is 1 RCRA-CESQG site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 11/12/2018 has revealed that there are 10 NY SHWS sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 12/31/2018 has revealed that there is 1 NY SWF/LF site within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 11/12/2018 has revealed that there are 25 NY LTANKS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

NY UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the NY UST list, as provided by EDR, has revealed that there are 9 NY UST sites within approximately 0.25 miles of the target property.

State and tribal voluntary cleanup sites

NY VCP: Voluntary Cleanup Agreements. The voluntary remedial program uses private monies to get contaminated sites remediated to levels allowing for the sites' productive use. The program covers virtually any kind of site and contamination.

A review of the NY VCP list, as provided by EDR, has revealed that there is 1 NY VCP site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/25/2019 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 2 EDR MGP sites within approximately 1 mile of the target property.

Summary Details:

Conditions at Proposal September 1997): The Fulton Avenue site is located on the west central portion of the Garden City Industrial Park. This property has been active since the early 1960s, and various tenants have occupied the property sincethat time including Genesco, Inc. 1964 to 1976), Halperin Knitting Mills 1975 to 1976), Robelan Displays, Inc. 1977 to an unknown date), and Cymann Designs, Inc. 1988 to present). Halperin Knitting Mills operated as a cutting mill. Knit fabrics were received in tubular form and the fabrics were then cut, cleaned, and sewed together. Waste products generated by Halperin included waste oils from the dry cleaning operation. Robelan Displays, Inc., manufactured displays at the site. Materials utili ed in this process included paints and lacquer thinners. Cymann Designs is a furniture distribution warehouse. In 1985, during a Nassau County Department of Health NCDH) ground water contamination study, the Garden City IndustrialPark was identified as a potential source for volatile organic compound VOC) contamination in the ground water. In 1991, the NCDH, together with the Nassau County Department of Public Works NCDPW), conducted a ground water study of the Garden City Industrial Park. During this investigation, twelve additional monitoring wells were installed within and downgradient of the park, and two monitoring wells were installed upgradient of the park. Two rounds of samples were collected from these wells, as well as the existing wells, and analysis indicated the presence of VOCs, including tetrachloroethene PCE). In 1994, a Preliminary Site Assessment PSA) was conducted by the New York State Department of Environmental Conservation NYSDEC). The study area investigated during this PSA included approximately 40 acres of the Garden City Industrial Park. During the PSA 61 ground water samples were collected and analy ed at an on-site mobile laboratory. Analysis of the ground watersamplesindicated the presence of numerous VOCs, including PCE and trichloroethene TCE). Based on these results, it was alleged that a source entry for the PCE contamination is present at 150 Fulton Avenue. Also as part of the PSA, an industrial survey was conducted by NYSDEC at several facilities within the Garden City Industrial Park, including Cymann Designs, Inc. Cymann Designs, Inc. is a wholesale distribution warehouse that reportedly does not use any chemicals in their business.Prior to Cymann Designs, Inc. a dry cleaner of cloth material occupied the building. In 1995, NYSDEC conducted additional sampling at the Garden City Industrial Park. One of these samples included a sediment sample collected from a dry well located at 150 Fulton Avenue. Analysis of this sample indicated the presence of 5,300,000 parts per billion of PCE. On June 18, 1996, a cooperative sampling event was conducted for the Fulton Avenue site by NYSDEC and EPA. During this sampling event, ground water samples were collected from several monitoring wells located within the Garden City Industrial Park. Analysis of the samples collected from these wells indicated the presence of PCE, TCE, and 1,2-dichloroethene total) in wells downgradient of the dry well located at 150 Fulton Avenue. Drinking water wells tapping the Upper Glacial - Magothy Aquifer System within four miles of the site serve an aggregate population of 100,528 people. The site is located

GENESCO INC SITE 11530 (Continued) **1000855816**

over a NewYork State-designated Wellhead Protection Area. Status March 1998): Currently, two Interim Remedial Measures IRMs) are planned for the site, one for soils in the immediate vicinity of the dry well, and a second for nearby ground water. Thesoil IRM will consist of removing contaminated sediments and soils from the base of the dry well, remediating the deep soils using two technologies entitled Air Sparging/Soil Vapor Extraction AS/SVE). The design for the soil IRM is currently underreview. The nearby ground water within the shallow Upper Glacial aquifer will be remediated using an in-well air-stripping system. The conceptuali ation for this remediation technology is currently being prepared. The Remedial Investigation/Feasibility Study RI/FS) workplan is currently being reviewed. The description of the site release) is based on information available at the time the site was scored. The description may change as additional information is gathered on the sources and extent of contamination. See 56 FR 5600, February 11, 1991, or subsequent FR notices.

Site Description: Location: This facility is located at 150 Fulton Avenue in the Garden City Park Industrial Area in North Hempstead in Nassau County. Site Features: The area is generally flat and lies on the Long Island glacial outwash plain Current Zoning and Land use: The area is zoned commercial and is also generally commercial/industrial in use. Past Use of the Site: The Nassau County Department of Health identified the Garden City Park Industrial Area as a possible source of groundwater contamination in the report entitled "Investigation of Contaminated Aquifer Segments, Nassau County, New York, 1986." A subsequent investigation done by the Nassau County Department of Health and the County Department of Public Works identified a significant plume of tetrachloroethene (PCE) and other

GENESCO INC SITE 11530 (Continued) **1000855816**

volatile organics in the groundwater from the former use of the site as a knotting mill. The DEC completed a PSA in 1994 that identified the facility at 150 Fulton Avenue as the primary source for the tetrachloroethene. Historical information indicates that a former occupant of this facility used PCE in cutting mill operations. In 1995, environmental sampling confirmed the presence of high levels of tetrachloroethene in the sediments found in a dry well at the site. This source was the PCE groundwater contamination and was found to be migrating down gradient. Operable Units (OU): The site as now been broken down into two operable units, the PCE portion (OU1)and the majority trichlorethene, or TCE portion (OU2). Operable Unit 1: A soil vapor extraction/air sparging system IRM was installed and operated at the site from 1998 until December 2001. The PRP removed the SVE and air sparging system and installed a sub-slab depressurization system to address the concern of residual soil vapors impacting the indoor air (03/04). The responsible party funded the RI/FS at the site. The field work for this remedial investigation began in mid-December 1998. This site was nominated to the NPL in March 1997 and became a Federal Superfund Site effective April 1, 1998. The 150 Fulton Ave facility and its associated plume of contaminated groundwater is referred to as Operable Unit 1 (OU1). The NYSDEC oversaw the completion of the RI/FS under the NYSDEC Order on Consent and then transferred project management to USEPA for remedial design and remedial action (RD/RA). The EPA issued the OU 1 ROD in 2007. The OU1 ROD called for groundwater extraction and treatment, in-situ chemical oxidation for the source area and wellhead treatment for the village of Garden City. The USEPA prepared a ROD amendment for OU1 and released it with a public meeting in April 14th 2015. The USEPA executed the ROD amendment in September 2015. This ROD amendment calls for the Garden City Wells to continue operating with the treatment as the capture zone is intercepting the impacted groundwater in any case. The potential responsible party entered into a unilateral administrative order (UAO) filed by the US Dept of Justice. Operable Unit 2: The USEPA is also conducting an OU2 RI/FS to identify any additional sources of groundwater contamination from the unidentified side-gradient source(s) of trichloroethene impacting the Village of Garden City Wellfield No 9 and the Franklin Square Water District. The EPA has issued a work assignment for the OU2 field work. The consultant prepared a work plan (11/09) that was approved. This work includes additional source area investigation for the TCE plume which does not originate at 150 Fulton Ave. and a soil vapor investigation. Field work for the OU2 study is ongoing. EPA is using some of the newer environmental forensics techniques along with traditional testing in the ongoing attempt to locate additional solvent sources of contamination to the groundwater.

Env Problem: The groundwater has been heavily impacted with perchlorethene (PCE) from the 150 Fulton Ave. site (Operable Unit 1). There are also impacts from other volatile organic compounds (VOCs, mainly TCE, from unidentified side-gradient sources(Operable Unit 2). The contaminant plume has impacted the sole source aquifer downgradient of the site. The PRP operated an IRM consisting of a soil vapor extraction system and an air sparging unit. This IRM addressed soil contamination and shallow groundwater contamination beneath the site. The PRP also installed an IRM consisting of a wind-driven Sub-Slab depressurization system to address residual volatile vapors beneath the 150 Fulton Avenue building.

Health Problem: Since the site is covered by asphalt or pavement, people will not

GENESCO INC SITE 11530 (Continued) **1000855816**

come into contact with site-related contaminated soils or contaminated groundwater unless they dig below the ground surface. People are not drinking the contaminated groundwater because municipal water suppliers have taken appropriate actions (such as treating the groundwater to remove contaminants prior to distribution or removing wells from service) to ensure that the public water supply continues to meet drinking water standards. Volatile organic compounds in contaminated soils or contaminated groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings is referred to as soil vapor intrusion. A passive sub-slab depressurization system (system that removes air from beneath a building) has been installed in the on-site structure to prevent indoor air quality from being affected by soil vapor intrusion. The potential exists for soil vapor intrusion to impact indoor air quality in off-site structures.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description:	The site is located in the Village of Garden City, Massau County, in a residential area near the intersection of 11th Street, Cherry Valley road and Hilton Ave. This plant was very small and was not a coal gas plant, rather it utilized the Maxim Gas process which used gasoline as a feedstock to produce only about 4000 cubic feet of gas per day. This plant was operated from 1874 to about 1906 to supply gas to the Garden City Hotel and for streetlights. A Site Characterization was performed at the site which identified no contamination requiring further action. The Department issued a no further action letter for the site in October 2001.
Env Problem:	A Site Characterization was performed at the site which identified no contamination requiring further action. The Department issued a no further action letter for the site in October 2001.

Site Description:	The site consists of aircraft hangers where helicopters were stores and serviced. These structures are being demolished as the site is being redeveloped. the site is located in an industrial/commercial park. Releases of solvents or degreasers into on-site leaching pools has contaminated the soil and groundwater beneath the site, resulting in a significant threat to the environment. Groundwater beneath the site has been designated by the EPA as a sole source aquifer. See V00162.
Env Problem:	Discharges of Volatile Organic Compounds (VOCs) have impacted the soil and groundwater beneath the site resulting in a significant threat to the environment and a potential threat to a public water supply.

Environmental Interest/Information System
AIR EMISSIONS CLASSIFICATION UNKNOWN

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Site Description: This property consists of a one-story, 11,200 square foot masonry building which houses an active heating, ventilation and air conditioning contractor (Conair) in the front (northern) portion and a snack food distributor (Bonaire) in the rear (southern) portion. The rear portion of the building was occupied by Town Sheet Metal Works, Inc. from 1975 until September 1985. Operations at the site reportedly involved fabrication of sheet metal, particularly duct work. A 1986 NCDH report identified regional groundwater contamination in the Garden City Park Industrial Area (GCPIA). The plume consisted of volatile organic compounds (VOCs), predominantly chlorinated solvents, including tetrachloroethene (PCE), trichloroethene (TCE), 1,2-dichloroethene (1,2-DCE) and 1,1,1-trichloroethane (TCA). A follow-up investigation by NCDH and the Nassau County Department of Public Works (NCDPW) in 1993 confirmed elevated VOCs, in particular PCE, in groundwater within the GCPIA. In 1994, an area-wide Preliminary Site Assessment (PSA) was performed in the GCPIA, to identify potential sources of the VOC contamination. The results of sampling conducted during that investigation led the NYSDEC to conduct PSAs in 1995 at four facilities that had been identified as potential sources. Samples collected from locations upgradient of the Town Sheet Metal facility contained PCE, TCE, and TCA concentrations ranging from below detection limits (BDL) to 8.2, 1.2 and 3.6 micrograms per liter (ug/l) respectively. No upgradient samples contained 1,2-DCE. Downgradient samples for PCE, TCE and 1,2-DCE ranged from BDL to 9.6, 1.8 and 2.4 ug/l, but TCA ranged from 4.7 to 59 ug/l. The similar upgradient and downgradient PCE, TCE and 1,2-DCE results implied that there was an upgradient source for these compounds. The distribution of TCA, however, suggested that there was a source in the vicinity of the Town Sheet Metal Site. In the 1999 focused PSA, which was conducted in response to the 1995 PSA, TCA was detected in two on-site sediment samples and was again found at higher levels in

TOWN SHEET METAL WORKS (Continued) **S105586277**

	downgradient versus upgradient groundwater. The degree of threat posed by this contamination source was judged not to be significant.
Env Problem:	Both sediment and groundwater data indicate that 1,1,1-trichloroethane was disposed at this facility in the past. However, the levels are relatively low and do not present a significant threat.
Health Problem:	There is some evidence that volatile organic compounds (VOCs) were discharged into on-site drains. Only very low concentrations of contamination remain and they do not present a threat to public health. Groundwater at the site has been contaminated with VOCs at concentrations slightly above groundwater standards. A large VOC contaminant plume from the nearby 150 Fulton Avenue site and other sources is present downgradient from this site. Public water supply wells in the area of this larger regional contaminant plume are monitored for VOCs and treated if necessary.

Summary Details:

Conditions at Proposal October 22, 1999): The Jackson Steel site is an inactive roll form metal shapes manufacturing facility located in Mineola/North Hempstead, Nassau County, New York. It is not known when Jackson Steel began operating; however, they submitted a form/application to the Nassau County Health Department on October 19, 1977. Jackson Steel reportedly ceased operations at the site in April 1991. Degreasers, including tetrachloroethylene also referred to as perchloroethylene PCE)), trichloroethylene TCE), and 1,1,1-trichloroethane TCA), were used at the site until March 1985. Degreasing sludge was stored in drums on a paved area located southwest of the building. The site property is bordered to the northwestby First Street, to the northeast by an apartment building, to the southeast by a billiard parlor and an electronics store, and to the southwest by a paved parking area, law offices, and a bar/restaurant. The site is located on the edge of a mixed-use area, with commercial and industrial properties located to the south and west and residential properties located to the north and east. The Nassau County Department of Health conducted numerous inspections of the Jackson Steel site between1979 and 1996; improper spill control at the waste storage area was noted once, in 1981, during the period when degreasers were used on site. A Limited Phase II Assessment of the Jackson Steel site was performed in December 1991. During this inspection, a third dry well was observed in the building, in the loading dock. Soil samples collected beneath the dry wells indicated the presence of PCE, TCE, 1,1,1-TCA, 1,2-dichloroethylene DCE), and 1,1-dichloroethane DCA) at depths up to 17 feetbelow ground surface. 1,2-DCE is a degradation product of TCE and PCE and 1,1-DCA is a breakdown product of PCE, TCE, and 1,1,1-TCA. A reconnaissance of the site was conducted in November 1992 as part of an Environmental Site Investigation ESI). Numerous stained areas and puddles were observed in the building. Drums containing petroleum products were stored in the building and on the paved area. The dry wells were partially filled with liquid and a 275-gallon degreasing tank was observed in close proximity to the dry well located in the loading dock. Between December 1992 and February 1993, numerous samples were collected in, around, and below the dry wells and nine ground water samples at the site. The analytical results reportedly indicated the presence of PCE, TCE, 1,1,1-TCA, and 1,2-DCE at depths up to 40 feet below the ground level and PCE, TCE, 1,1,1-TCA, 1,2-DCE, and 1,1-DCA in ground water collected from monitoring wells located downgradient of the dry wells. The ESI report suggests that a release of PCE, TCE, and 1,1,1-TCA to ground water has occurred from the site. Drinking water within 4 miles of the site is derived from public/municipal supply wells screened in the Upper Glacial, Magothy, and Lloyd Aquifers. The nearest well drawing from the aquifer of concern is located approximately 3,100 feet south and side-gradient to the site. Potable wells within 4 miles of the site, and drawing from the aquifer of concern, serve over 300,000people. Status February 2000): EPA is considering various alternatives for this site. The description of the site is based on information available at the time the site was scored.

JACKSON STEEL (Continued) **1000272610**

The description may change as additional informationis gathered on the sources and extent of contamination. See 56 FR 5600, February 11, 1991, or subsequent FR notices.

Site Description: Location: The Jackson Steel Site is located in an urban area. It is on the southern side of First Street and the Eastern side of Herricks Road. It is located about 1,000 ft. east of the Garden City Park Industrial Area. Site Features: The main site feature is a 30,000 square foot one story former manufacturing building, constructed in 1959, and a 13,000 square foot back section that was added in 1963. Adjacent to this back section is a former retail facility and an active daycare center. The former retail facility and daycare are not part of the state defined site, however, EPA included them for purposes of their remedial action. The daycare expanded into the former retail facility in 2016. Current Zoning and Land Use: Jackson Steel ceased operations in 1991. The building is currently vacant. The property is currently zoned B-1 business. A restaurant and offices are located immediately west of the site. An industrial park is located west of Herricks Road. Residences are located immediately east of the site, and mixed business / residential on the north side of First Street. The Long Island Railroad is located south of the day care. Past Use of the Site: The property was used from the mid-1970s until 1991 as a roll form metal shapes manufacturing facility. Degreasers, including tetrachloroethylene (PCE), trichloroethylene (TCE), and 1,1,1-trichloroethane (TCA), were used at the facility until 1985. Sludges from degreasing equipment were stored in drums and in an onsite 275-gallon tank. Dumping of wastes into the dry wells, spills, and leaks during the facility s operations and from drums storing various chemicals are the likely sources of the contamination found at the Site. In December 1991, a limited environmental assessment of the former Jackson Steel Products property was conducted by Geraghty and Miller, Inc., environmental consultants. A Nassau County Department of Health (NC DOH) survey

JACKSON STEEL (Continued) **1000272610**

inspection was conducted at the site in May 1994. In October 1999, the Site was proposed for placement on EPA s Superfund National Priorities List (NPL). On February 4, 2000, the Site was listed on the NPL. Site Geology and Hydrogeology: Site geology consists of three units: the Upper Glacial Aquifer, the Magothy Confining Bed, and the Magothy Aquifer. Regional groundwater flow is to the southwest. Historic remedial groundwater elevation measuring events indicated the shallow groundwater was influenced by local water withdrawals, resulting in a variable flow direction. The Upper Glacial unit consists of sands and gravels that extend to a depth of approximately 105 feet below ground surface (bgs). Little to no clay was observed. Groundwater beneath the Jackson Steel site occurs within the Upper Glacial Aquifer at approximately 50 feet bgs. At approximately 105 feet bgs, the top of the Magothy Formation was encountered; clays were observed and believed to significantly inhibit downward migration of contaminants.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were TCE, PCE, SVOCs, pesticides and metals in soil; TCE, PCE and their breakdown products in groundwater and PCE in soil vapor and indoor air. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Groundwater standards were met in the Upper Glacial Aquifer in 2009. Residual contamination in the soil, soil vapor and indoor air is being managed under a Site Management Plan composed of a Vapor Intrusion Management Plan and Institutional Control Implementation and Assurance Plan.

Health Problem: Drinking contaminated groundwater is not expected because public water serves the area that is treated prior to distribution. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affects the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, referred to as soil vapor intrusion. Measures are in place to protect future occupants of the on-site building from potential exposures via soil vapor intrusion. A sub-slab depressurization system (system that ventilates/removes air from beneath the building) has been installed in an adjacent off-site building to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the building.

Site Description: Location: The Jackson Steel Site is located in an urban area. It is on the southern side of First Street and the Eastern side of Herricks Road. It is located about 1,000 ft. east of the Garden City Park Industrial Area. Site Features: The main site feature is a 30,000 square foot one story former manufacturing building, constructed in 1959, and a 13,000 square foot back section that was added in 1963. Adjacent to this back section is a former retail facility and an active daycare center. The former retail facility and daycare are not part of the state defined site, however, EPA included them for purposes of their remedial action. The daycare expanded into the former retail facility in 2016. Current Zoning and Land Use: Jackson Steel ceased operations in 1991. The building is currently vacant. The property is currently zoned B-1 business. A restaurant and offices are located immediately west of the site. An industrial park

JACKSON STEEL (Continued) **1000272610**

is located west of Herricks Road. Residences are located immediately east of the site, and mixed business / residential on the north side of First Street. The Long Island Railroad is located south of the day care. Past Use of the Site: The property was used from the mid-1970s until 1991 as a roll form metal shapes manufacturing facility. Degreasers, including tetrachloroethylene (PCE), trichloroethylene (TCE), and 1,1,1-trichloroethane (TCA), were used at the facility until 1985. Sludges from degreasing equipment were stored in drums and in an onsite 275-gallon tank. Dumping of wastes into the dry wells, spills, and leaks during the facility s operations and from drums storing various chemicals are the likely sources of the contamination found at the Site. In December 1991, a limited environmental assessment of the former Jackson Steel Products property was conducted by Geraghty and Miller, Inc., environmental consultants. A Nassau County Department of Health (NC DOH) survey inspection was conducted at the site in May 1994. In October 1999, the Site was proposed for placement on EPA s Superfund National Priorities List (NPL). On February 4, 2000, the Site was listed on the NPL. Site Geology and Hydrogeology: Site geology consists of three units: the Upper Glacial Aquifer, the Magothy Confining Bed, and the Magothy Aquifer. Regional groundwater flow is to the southwest. Historic remedial groundwater elevation measuring events indicated the shallow groundwater was influenced by local water withdrawals, resulting in a variable flow direction. The Upper Glacial unit consists of sands and gravels that extend to a depth of approximately 105 feet below ground surface (bgs). Little to no clay was observed. Groundwater beneath the Jackson Steel site occurs within the Upper Glacial Aquifer at approximately 50 feet bgs. At approximately 105 feet bgs, the top of the Magothy Formation was encountered; clays were observed and believed to significantly inhibit downward migration of contaminants.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were TCE, PCE, SVOCs, pesticides and metals in soil; TCE, PCE and their breakdown products in groundwater and PCE in soil vapor and indoor air. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Groundwater standards were met in the Upper Glacial Aquifer in 2009. Residual contamination in the soil, soil vapor and indoor air is being managed under a Site Management Plan composed of a Vapor Intrusion Management Plan and Institutional Control Implementation and Assurance Plan.

Health Problem: Drinking contaminated groundwater is not expected because public water serves the area that is treated prior to distribution. Volatile organic compounds in the groundwater and/or soil may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affects the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, referred to as soil vapor intrusion. Measures are in place to protect future occupants of the on-site building from potential exposures via soil vapor intrusion. A sub-slab depressurization system (system that ventilates/removes air from beneath the building) has been installed in an adjacent off-site building to prevent the indoor air quality from being affected by the contamination in soil vapor beneath the building.

FUMEX TERMITE SERVICE (Continued) **1002986042**

Site Description: Location: The Fumex Sanitation site is an inactive hazardous waste located on the corner of Bedford Avenue and Main Street (also known as Herricks Road) at 131 Herricks Road in the Village of Garden City Park in the Town of North Hempstead, Nassau County, New York. Site Features: The 0.24 acre site includes a one-story brick building and a paved parking area in the rear. The site is bordered on the north by Bedford Avenue, Herricks Road on the east, residential property to the west, and commercial property to the south. Access to the site is from the Bedford Avenue. Current Zoning/Use(s): The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of residential, commercial, light industrial, and utility right-of-ways. A residential area borders the site to the west along Bedford Avenue. Historic Use(s): Fumex Termite Service Corporation operated a commercial termite extermination business at this location from 1952 to 1992. Reportedly, the originally unpaved parking lot was sprayed regularly with chlordane for insect control from 1952 to 1978. The parking lot was then paved sometime between 1978 and 1981. In 1981, a chlordane rinse water spill of less than 30 gallons occurred in the asphalt parking lot. Some of the rinse water entered a dry well located within the parking lot. Site investigations have confirmed that chlordane and other pesticides contaminated soil and the groundwater beneath the site and the soil of a neighboring yard. Site Geology and Hydrogeology: Beneath the Fumex Sanitation site are approximately 800 feet of unconsolidated deposits overlying crystalline bedrock. The shallowest soils beneath the site are the Upper Glacial formation. The Upper Glacial formation consists of Pleistocene age outwash sands and gravels and is approximately 100 feet thick in the vicinity of the Fumex Sanitation site. The depth to groundwater is approximately 40 to 50 feet below grade. Shallow groundwater flow is generally to the southwest. Immediately beneath the Upper Glacial formation is the Magothy formation. The Magothy is composed of sands with intermittent clay layers and is 300 to 400 feet thick in the vicinity of the site. The Magothy formation is used as the primary aquifer for public drinking water in Nassau County, with most wells screened 300-400 feet below the water table. Beneath the Magothy formation is the Raritan formation, consisting of the Raritan clay and the Lloyd sand. The Raritan formation is approximately 300 feet thick and overlies bedrock.

Env Problem: Remediation at the site is complete. Environmental and Institutional controls in place. Prior to remediation, the primary contaminants of concern were heptachlor, chlordane, and dieldrin in the soil and groundwater. Groundwater samples, collected from on-site and off-site monitoring wells, continue to indicate that heptachlor, chlordane and dieldrin detected in the on-site monitoring wells is not migrating off-site.

Health Problem: Some contaminated soils remain at the site below concrete or clean backfill, however, people will not come in contact with contaminated soils unless they dig below the surface materials. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

Site Description:	Location: The Fumex Sanitation site is an inactive hazardous waste located on the corner of Bedford Avenue and Main Street (also known as Herricks Road) at 131 Herricks Road in the Village of Garden City Park in the Town of North Hempstead, Nassau County, New York. Site Features: The 0.24 acre site includes a one-story brick building and a paved parking area in the rear. The site is bordered on the north by Bedford Avenue, Herricks Road on the east, residential property to the west, and commercial property to the south. Access to the site is from the Bedford Avenue. Current Zoning/Use(s): The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of residential, commercial, light industrial, and utility right-of-ways. A residential area borders the site to the west along Bedford Avenue. Historic Use(s): Fumex Termite Service Corporation operated a commercial termite extermination business at this location from 1952 to 1992. Reportedly, the originally unpaved parking lot was sprayed regularly with chlordane for insect control from 1952 to 1978. The parking lot was then paved sometime between 1978 and 1981. In 1981, a chlordane rinse water spill of less than 30 gallons occurred in the asphalt parking lot. Some of the rinse water entered a dry well located within the parking lot. Site investigations have confirmed that chlordane and other pesticides contaminated soil and the groundwater beneath the site and the soil of a neighboring yard. Site Geology and Hydrogeology: Beneath the Fumex Sanitation site are approximately 800 feet of unconsolidated deposits overlying crystalline bedrock. The shallowest soils beneath the site are the Upper Glacial formation. The Upper Glacial formation consists of Pleistocene age outwash sands and gravels and is approximately 100 feet thick in the vicinity of the Fumex Sanitation site. The depth to groundwater is approximately 40 to 50 feet below grade. Shallow groundwater flow is generally to

FUMEX TERMITE SERVICE (Continued) **1002986042**

	the southwest. Immediately beneath the Upper Glacial formation is the Magothy formation. The Magothy is composed of sands with intermittent clay layers and is 300 to 400 feet thick in the vicinity of the site. The Magothy formation is used as the primary aquifer for public drinking water in Nassau County, with most wells screened 300-400 feet below the water table. Beneath the Magothy formation is the Raritan formation, consisting of the Raritan clay and the Lloyd sand. The Raritan formation is approximately 300 feet thick and overlies bedrock.
Env Problem:	Remediation at the site is complete. Environmental and Institutional controls in place. Prior to remediation, the primary contaminants of concern were heptachlor, chlordane, and dieldrin in the soil and groundwater. Groundwater samples, collected from on-site and off-site monitoring wells, continue to indicate that heptachlor, chlordane and dieldrin detected in the on-site monitoring wells is not migrating off-site.
Health Problem:	Some contaminated soils remain at the site below concrete or clean backfill, however, people will not come in contact with contaminated soils unless they dig below the surface materials. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

FUMEX TERMITE SERVICE (Continued) **1002986042**

The Upper Glacial formation consists of Pleistocene age outwash sands and gravels and is approximately 100 feet thick in the vicinity of the Fumex Sanitation site. The depth to groundwater is approximately 40 to 50 feet below grade. Shallow groundwater flow is generally to the southwest. Immediately beneath the Upper Glacial formation is the Magothy formation. The Magothy is composed of sands with intermittent clay layers and is 300 to 400 feet thick in the vicinity of the site. The Magothy formation is used as the primary aquifer for public drinking water in Nassau County, with most wells screened 300-400 feet below the water table. Beneath the Magothy formation is the Raritan formation, consisting of the Raritan clay and the Lloyd sand. The Raritan formation is approximately 300 feet thick and overlies bedrock.

Env Problem: Remediation at the site is complete. Environmental and Institutional controls in place. Prior to remediation, the primary contaminants of concern were heptachlor, chlordane, and dieldrin in the soil and groundwater. Groundwater samples, collected from on-site and off-site monitoring wells, continue to indicate that heptachlor, chlordane and dieldrin detected in the on-site monitoring wells is not migrating off-site.

Health Problem: Some contaminated soils remain at the site below concrete or clean backfill, however, people will not come in contact with contaminated soils unless they dig below the surface materials. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

Site Description: Location: The Fumex Sanitation site is an inactive hazardous waste located on the corner of Bedford Avenue and Main Street (also known as Herricks Road) at 131 Herricks Road in the Village of Garden City Park in the Town of North Hempstead, Nassau County, New York. Site Features: The 0.24 acre site includes a one-story brick building and a paved parking area in the rear. The site is bordered on the north by Bedford Avenue, Herricks Road on the east, residential property to the west, and commercial property to the south. Access to the site is from the Bedford Avenue. Current Zoning/Use(s): The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of residential, commercial,

FUMEX TERMITE SERVICE (Continued) **1002986042**

light industrial, and utility right-of-ways. A residential area borders the site to the west along Bedford Avenue. Historic Use(s): Fumex Termite Service Corporation operated a commercial termite extermination business at this location from 1952 to 1992. Reportedly, the originally unpaved parking lot was sprayed regularly with chlordane for insect control from 1952 to 1978. The parking lot was then paved sometime between 1978 and 1981. In 1981, a chlordane rinse water spill of less than 30 gallons occurred in the asphalt parking lot. Some of the rinse water entered a dry well located within the parking lot. Site investigations have confirmed that chlordane and other pesticides contaminated soil and the groundwater beneath the site and the soil of a neighboring yard. Site Geology and Hydrogeology: Beneath the Fumex Sanitation site are approximately 800 feet of unconsolidated deposits overlying crystalline bedrock. The shallowest soils beneath the site are the Upper Glacial formation. The Upper Glacial formation consists of Pleistocene age outwash sands and gravels and is approximately 100 feet thick in the vicinity of the Fumex Sanitation site. The depth to groundwater is approximately 40 to 50 feet below grade. Shallow groundwater flow is generally to the southwest. Immediately beneath the Upper Glacial formation is the Magothy formation. The Magothy is composed of sands with intermittent clay layers and is 300 to 400 feet thick in the vicinity of the site. The Magothy formation is used as the primary aquifer for public drinking water in Nassau County, with most wells screened 300-400 feet below the water table. Beneath the Magothy formation is the Raritan formation, consisting of the Raritan clay and the Lloyd sand. The Raritan formation is approximately 300 feet thick and overlies bedrock.

Env Problem: Remediation at the site is complete. Environmental and Institutional controls in place. Prior to remediation, the primary contaminants of concern were heptachlor, chlordane, and dieldrin in the soil and groundwater. Groundwater samples, collected from on-site and off-site monitoring wells, continue to indicate that heptachlor, chlordane and dieldrin detected in the on-site monitoring wells is not migrating off-site.

Health Problem: Some contaminated soils remain at the site below concrete or clean backfill, however, people will not come in contact with contaminated soils unless they dig below the surface materials. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

The depth to groundwater is approximately 40 to 50 feet below grade. Shallow groundwater flow is generally to the southwest. Immediately beneath the Upper Glacial formation is the Magothy formation. The Magothy is composed of sands with intermittent clay layers and is 300 to 400 feet thick in the vicinity of the site. The Magothy formation is used as the primary aquifer for public drinking water in Nassau County, with most wells screened 300-400 feet below the water table. Beneath the Magothy formation is the Raritan formation, consisting of the Raritan clay and the Lloyd sand. The Raritan formation is approximately 300 feet thick and overlies bedrock.

Env Problem: Remediation at the site is complete. Environmental and Institutional controls in place. Prior to remediation, the primary contaminants of concern were heptachlor, chlordane, and dieldrin in the soil and groundwater. Groundwater samples, collected from on-site and off-site monitoring wells, continue to indicate that heptachlor, chlordane and dieldrin detected in the on-site monitoring wells is not migrating off-site.

Health Problem: Some contaminated soils remain at the site below concrete or clean backfill, however, people will not come in contact with contaminated soils unless they dig below the surface materials. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

State and tribal institutional control / engineering control registries

RES DECL: Restrictive Declarations Listing
A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

VCP: Voluntary Cleanup Agreements
New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

PFAS: PFAS Contamination Site Location Listing

DEC surveyed select businesses, fire departments, fire training centers, bulk storage facilities, airports, and Department of Defense (DoD) facilities. The responses to the survey have helped to determine if these entities used or stored materials containing PFOA/PFOS including AFFF and dispersants used in Teflon coating operations. The results of this survey will be updated periodically as additional responses are received..

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

E DESIGNATION: E DESIGNATION SITE LISTING
The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 02/11/2019

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248

Version Date:	2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

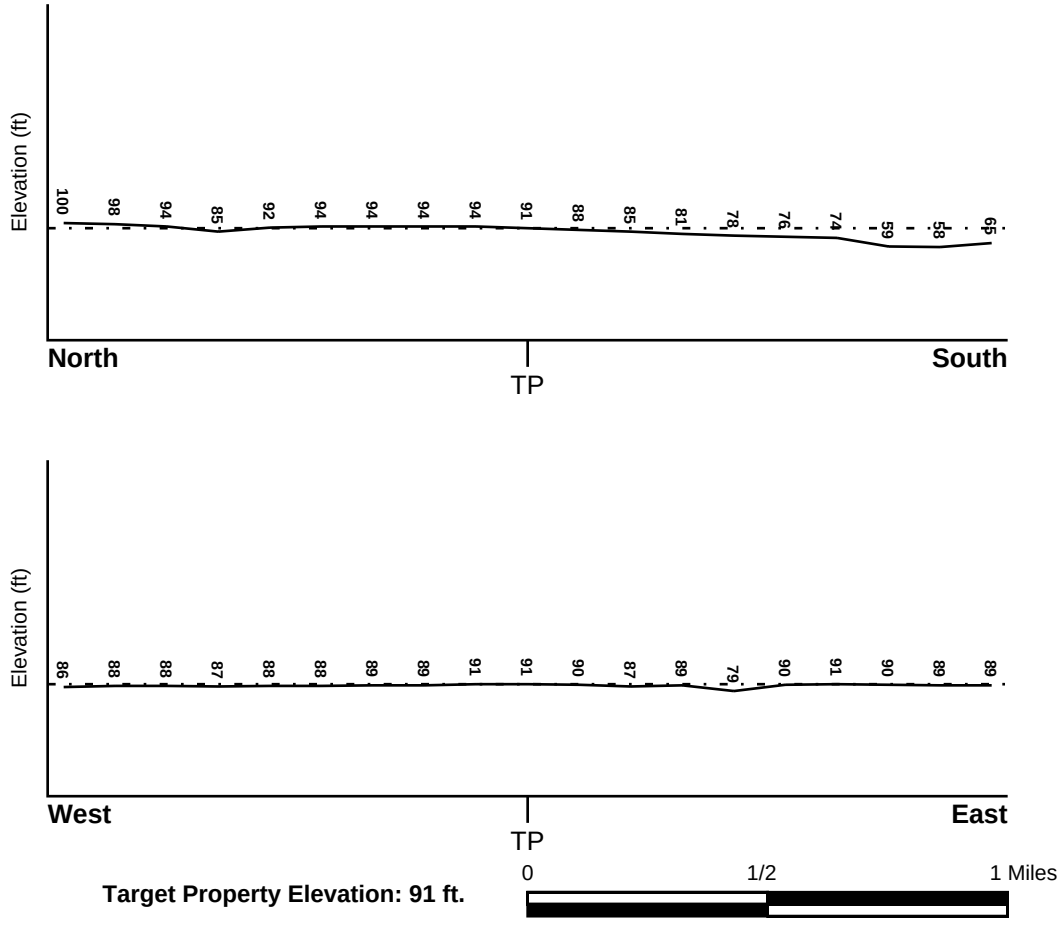

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 91 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
36059C0207F	FEMA Q3 Flood data

Additional Panels in search area:	FEMA Source Type
36059C0206F	FEMA Q3 Flood data

36059C0209F	FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LYNBROOK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/2 - 1 Mile NW
Site Name:	Fulton Avenue Site
Site EPA ID Number:	NY0000110247
Surficial Aquifer Flow Dir.:	SW IN THE WATER TABLE AQUIFER AT AN AVERAGE VELOCITY OF 0.67 FEET PER DAY.
Measured Depth to Water:	approximately 55 to 45 feet above mean sea level (MSL) in the water table aquifer, approximately 46 to 55 feet MSL in the deep upper glacial aquifer, and approximately 44 to 50 feet MSL in the Upper Magothy aquifer.
Hydraulic Connection:	An upward gradient exists in one well pair in the upper glacial aquifer, but data for other well pairs is not reliable. A downward gradient exists in the one well pair screened in the upper glacial and Magothy aquifers.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information based on site-specific subsurface investigations is documented in the CERCLIS investigation report(s)

* ©1996 Site--specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Pleistocene
Code:	Qp *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: loam
sandy loam
sand

Surficial Soil Types: loam
sandy loam
sand

Shallow Soil Types: sandy loam

Deeper Soil Types: very gravelly - sand
coarse sand

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

FED USGS **USGS40000830027**

Organization ID:	USGS-NY	Organization Name:	USGS New York Water Science Center
Monitor Location:	N 1126. 3	Type:	Well
Description:	OLD: N 1126. 2	HUC:	02030202
Drainage Area:	Not Reported	Drainage Area Units:	Not Reported
Contrib Drainage Area:	Not Reported	Contrib Drainage Area Unts:	Not Reported
Aquifer:	Northern Atlantic Coastal Plain aquifer system		
Formation Type:	Glacial Aquifer, Upper	Aquifer Type:	Not Reported
Construction Date:	Not Reported	Well Depth:	73
Well Depth Units:	ft	Well Hole Depth:	73
Well Hole Depth Units:	ft		

Ground water levels,Number of Measurements:	116	Level reading date:	1990-03-26

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Oil and Gas Well Database
Source: Department of Environmental Conservation
Telephone: 518-402-8072
These files contain records, in the database, of wells that have been drilled.

RADON

State Database: NY Radon
Source: Department of Health
Telephone: 518-402-7556
Radon Test Results

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary faultlines, prepared in 1975 by the United State Geological Survey
